

The Research Group

Huntingdonshire

Annual demographic and socio-economic report

April 2011

Executive summary

This report presents the latest available information on the demographic and socio-economic make-up of Huntingdonshire. It investigates Huntingdonshire's population structure and composition; presents information on housing and the economic background; and discusses crime, health, education, and environment information pertaining to the area. Links are provided to other relevant reports and data sources.

Data used in this report has been collected from local and national level sources, and is presented at ward, district or county level for comparative purposes where relevant. Main highlights of the report are:

- The Cambridgeshire County Council Research Group (CCCRG) mid-2009 population estimate for Huntingdonshire is 164,600. The population has increased by 5% since 2001 and it is forecast to increase by a further 7% by 2031.
- Huntingdonshire has the highest proportion of its residents aged 40-64 of all the districts. In future, its age structure is forecast to age, with all age groups younger than 64 decreasing as proportions of total population and all older age groups increasing.
- CCCRG estimates the number of households in 2009 as 69,300. This represents 10% growth since 2001 and is forecast to increase by a further 18% by 2031.
- Huntingdonshire has the second lowest average house price in the county. Between Jun-Nov 2002 and Jun-Nov 2010 house prices increased by 84%.
- 80% of Huntingdonshire's working age is economically active. In December 2010 the Jobseekers' Allowance claimant count unemployment rate was 2% compared to a national level of 3.5%.
- Life expectancy at birth is higher in Huntingdonshire than in England. The difference is statistically significant for both males and females. Females are expected to live 4 years longer than men.
- Huntingdonshire has the third lowest levels of overall mortality in Cambridgeshire. The most common causes of premature deaths are circulatory diseases and cancer.
- The Crime & Disorder Reduction Partnerships (CDRP) has recorded a 3% reduction in total crime between 2009 and 2010.
- Over the last five years the percentage of pupils gaining 5 or more A*-C grades in Huntingdonshire has increased from 59% to 75%.
- In 2008 Huntingdonshire had the highest total but third lowest per capita CO₂ emissions in Cambridgeshire.
- In 2010 CCCRG group launched an interactive atlas that contains a range of socio-economic and demographic data for each ward in the county. The atlas can be accessed through the CCCRG website: <http://map1.cambridgeshire.gov.uk/observe/Flash/Profiles/WardProfiles/atlas.html>

Structure

The report is structured as follows: An introduction to Huntingdonshire's historical and geographical background is provided. Section 1 evaluates population data. Section 2 explores household growth and housing trends. Section 3 examines the economic state, presenting employment rates, earnings, and industry expansion data. Section 4 reports on health, and Section 5 provides information on the incidence of crime. Section 6 gives an overview of educational attainment and Section 7 discusses human-caused pollution. The final section reviews Cambridgeshire County Council Research Group's (CCCRG) customer insight tools. Finally a number of appendices present additional data for reference use.

The information contained in the report can be reproduced by other parties but must be appropriately referenced, and data should be referenced as indicated in the tables.

This report has been designed primarily to be viewed on-screen, with active links to related documents and website. Some of the charts displayed are best viewed in colour. If you have any problem viewing data please contact CCCRG.

The maps in this report are reproduced from Ordnance Survey material with the permission of Ordnance Survey on behalf of the Controller of Her Majesty's Stationery Office.

Introduction

Huntingdonshire covers approximately 91,300 hectares of the northwestern part of Cambridgeshire County. It is the County's largest district by land area and population. Huntingdonshire lies south of Peterborough (Unitary Authority), and shares boundaries with Fenland, East Cambridgeshire and South Cambridgeshire districts in the east, and Northamptonshire and Bedfordshire counties in the west. The River Ouse crosses the district in the south, and the River Nene forms the northern and western boundaries.

Huntingdonshire has four main market towns: Huntingdon, St Ives, St Neots and Ramsey. It is predominantly rural, with village settlements providing the main focus for community facilities outside of the market towns. While Huntingdon is the district's administrative hub – the District Council is based there – the largest town by population is actually St. Neots.

Huntingdonshire is a place rich in history and in environmental assets. The town of Huntingdon grew up around the River Great Ouse. Four centuries of Roman rule left its mark there, with the creation of the long straight Roman roads of Ermine street and the Via Devana, which converges on Godmanchester from Cambridge. It once boasted 16 churches, evidence of its prosperous history. Huntingdon retains its character as a market town. It has a mainly traffic-free high street, and an impressive market square flanked by the 18th century Town Hall, and the 13th century All Saints Church. There are more than 2000 Listed Buildings (buildings designated as being of special architectural or historic interest) in the district.

Geographically, the north and eastern areas of Huntingdonshire are peat fen, but most of it sits on a clay plateau, which tilts gradually upwards from the fen edge to the western boundary. Huntingdonshire has a wide variety of woodland, meadowland and wetlands, including Brampton Wood, the second largest wood in Cambridgeshire, and Monks Wood National Nature Reserve where over 1000 species of beetles have been recorded. These habitats are home to many birds and insects, and a large number of deer. Among the district's sites of special scientific interest (SSSIs) are Paxton Pits Nature Reserve and Grafham Water (Nature Reserve).

Huntingdonshire is well connected to other parts of the country via main roads. The A1 is an important north-south link to Huntingdon (much of it is to motorway standard). The A14 links Huntingdonshire with the Midlands in the west and the ports of Harwich and Felixstowe in the east. The A14 also links Huntingdonshire with the M11 as an additional route in to London. The M11 connects with the M25 to give good access to the South East and South Coast. Huntingdon and St Neots are connected with London Kings Cross by a frequent 50 minute railway service.

Huntingdonshire District Council is composed of 52 councillors representing 29 wards. It also contains 81 parishes.

1. Population

1.1. Population size and growth

In 2009 an estimated 164,600 people lived in Huntingdon, which accounted for 27% of Cambridgeshire's total population and 21% of the combined populations of Cambridgeshire and Peterborough.

Table 1 shows population growth in Huntingdonshire as compared to district, county, regional, and national figures. It suggests that Huntingdonshire's population increased by an average of around 900 per year since 2001. Total growth over the period 2001-2009 was 7,400, or 5%. That is the lowest in Cambridgeshire. Huntingdonshire also experienced a lower growth rate than the East of England region and England.

Table 1: Population in Huntingdonshire, Cambridgeshire, the East of England and England, 2001-31

Area	2001	Change 2001-09	% Change	2009	Change 2009-31	% Change	2031
Cambridge City	109,900	9,200	8.4%	119,100	32,700	27.5%	151,800
East Cambridgeshire	70,900	9,400	13.3%	80,300	17,900	22.3%	98,200
Fenland	83,700	9,600	11.5%	93,300	19,900	21.3%	113,200
Huntingdonshire	157,200	7,400	4.7%	164,600	12,200	7.4%	176,800
South Cambridgeshire	130,600	13,000	10.0%	143,600	38,300	26.7%	181,900
Cambridgeshire	552,100	48,700	8.8%	600,800	120,600	20.1%	721,400
Cambridgeshire and Peterborough	707,400	66,200	9.4%	773,600	185,300	24.0%	958,900
East England*	5,400,000	370,100	6.9%	5,770,100	1,246,400	21.6%	7,016,500
England*	49,450,000	2,367,100	4.8%	51,817,100	8,253,600	15.9%	60,070,700

Sources: 2001 figures from 2001 Census; 2009 figures from CCCRG mid-2009 population estimates, 2031 figures from CCCRG mid-2009 population forecast; *2009 figures from ONS mid-2009 population estimates, 2031 figures from DCLG 2008-based sub-national population projections.

Huntingdonshire's population is forecast to increase by 12,200, from 164,600 in 2009 to 176,800 in 2031. This suggests around 7% growth at an annual rate of 900. The low growth rate is indicative of the low level of residential building expected to take place within the district over the next 22 years (see Appendix 4 for forecast methodology). CCCRG forecasts that almost all of Huntingdonshire's growth will be attributable to natural change (the difference between births and deaths). Huntingdonshire's growth is forecast to be the lowest in Cambridgeshire.

1.2. Age structure

Huntingdonshire has an ageing population. Figure 1 (below) reveals that whereas in 2001 54% of the population was younger than 40, in 2031 that proportion is expected to drop to 42%. Proportional increases will occur in the 65+ age group, from 13% in 2001 to 27% in 2031. The biggest proportional decline will occur in the 25-39 age group, from 23% in 2001 to approximately 17% in 2021. Similarly, the proportion of under-20s is expected to decline from 26% of the population in 2001 to 21% in 2031.

Figure 1: Age structure of the population in Huntingdonshire, 2001-2031

Source: CCCRG mid-2009 population forecast

In most respects, in 2009 all the districts except Cambridge City share broadly similar age structures. Cambridge City is distinguished due to its large student population.

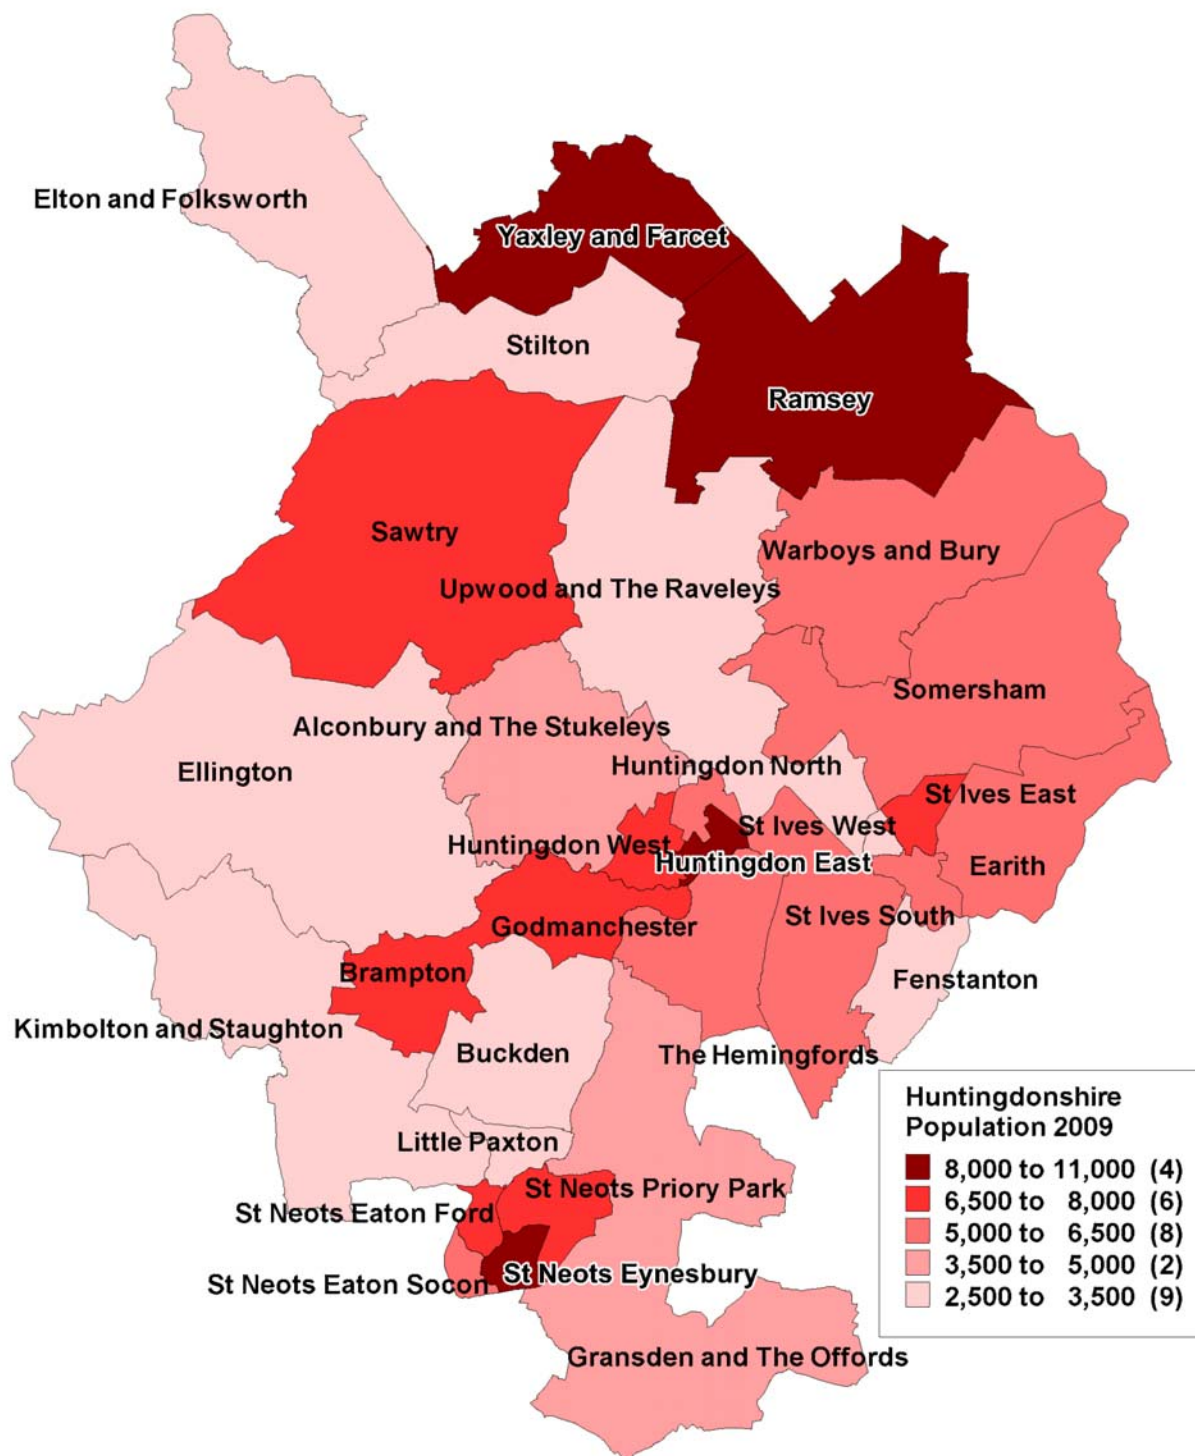

Within Cambridgeshire, Huntingdonshire has the highest proportion of 40-64 year olds in its population, the second highest proportion for 0-39 year olds, and the second lowest proportion of 65+ year olds. If Cambridge City is excluded, most age groups between 0-39 in Huntingdonshire are close to the county mean as proportions of population.

1.3. Where people live in the district

Figure 2 (below) shows that Huntingdonshire's most populated wards are Yaxley and Farcet (10,560), St. Neots Eynesbury (10,240) and Huntingdon East (8,860). Its least populated wards are Elton and Folksworth (2,730), St. Ives West (2,840), and Little Paxton (3,050).

Figure 3 (below) shows that the most densely populated wards are Huntingdon East, St. Neots Eynesbury, and St. Neots Eaton Ford. The least densely populated are Ellington and Upwood and the Raveleys.

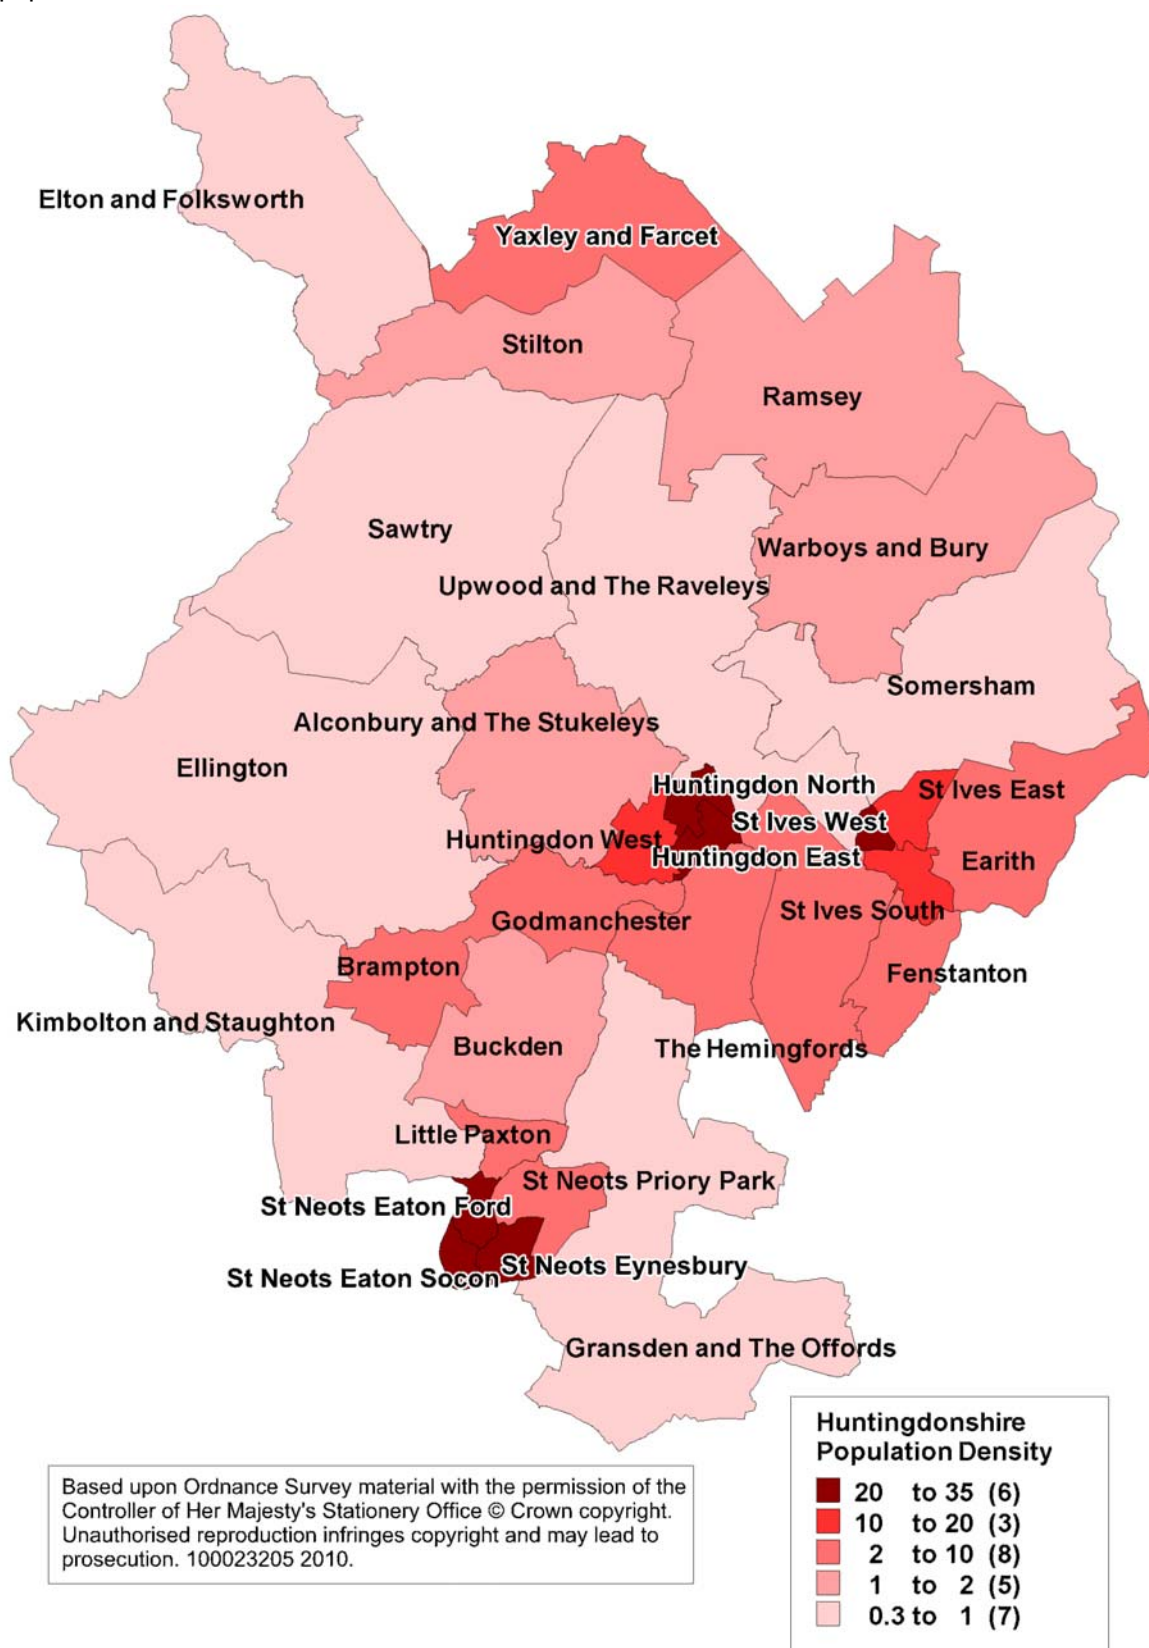

Figure 2: Map of Huntingdonshire's population by ward

Based upon Ordnance Survey material with the permission of the Controller of Her Majesty's Stationery Office © Crown copyright. Unauthorised reproduction infringes copyright and may lead to prosecution. 100023205 2010.

Figure 3: Map of Huntingdonshire's population density by ward

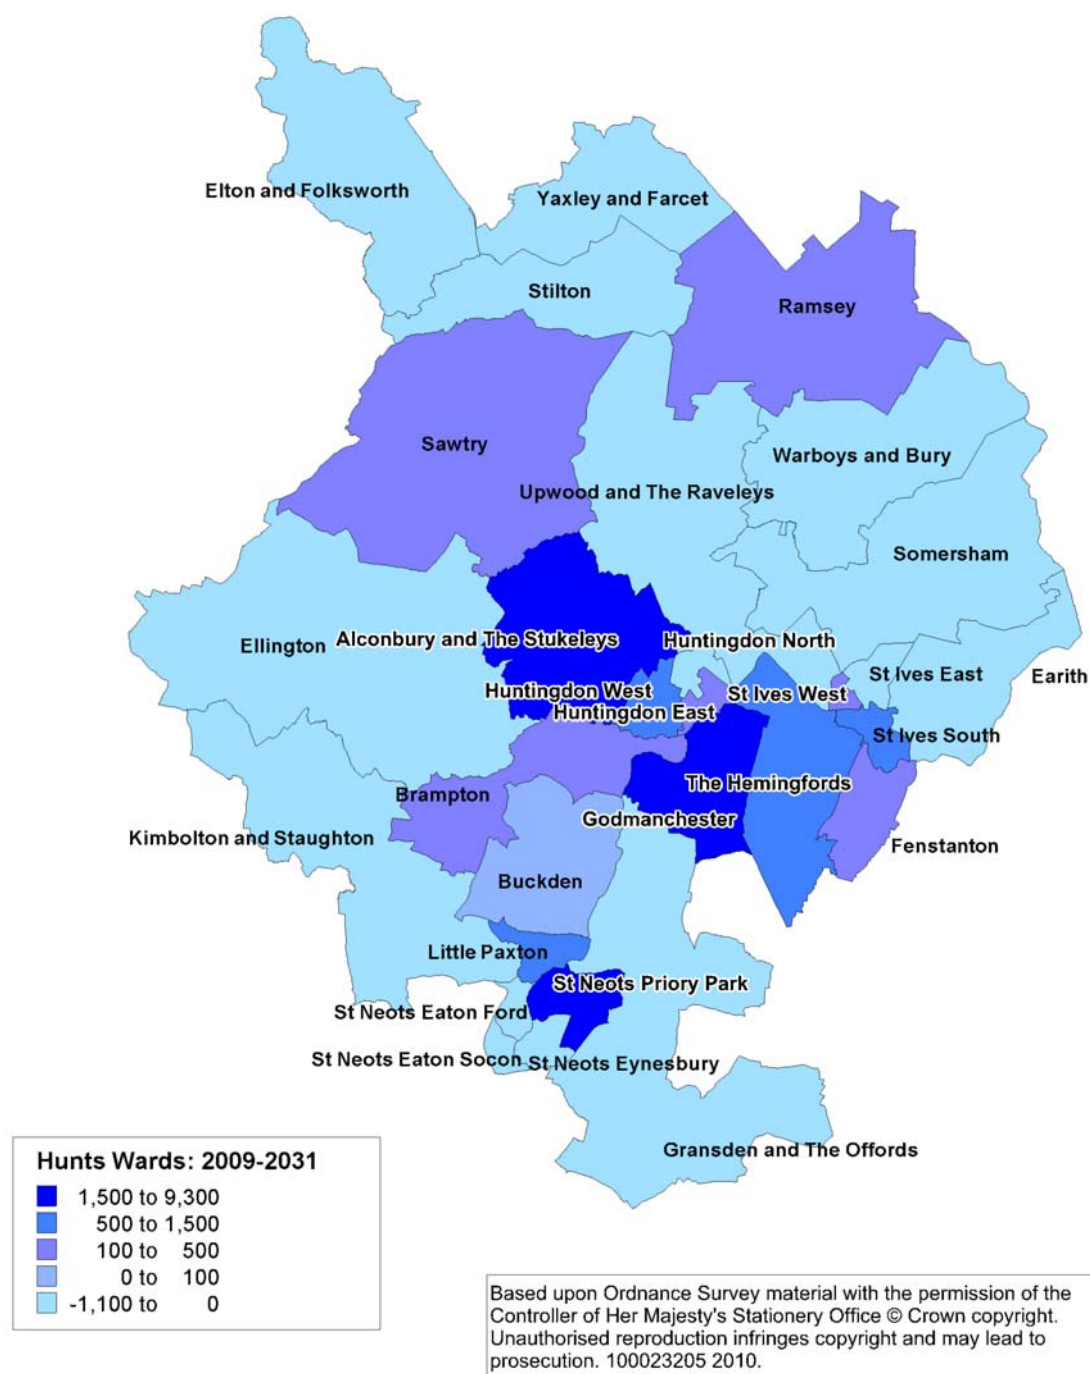

Density here is a measure of population per ward hectare. Wards with large areas of unoccupied land (i.e. parks, agricultural land) will necessarily have lower densities even if the occupied land is as densely populated as other wards.

1.4. Changing settlement patterns

Between 2001 and 2009, the population in Huntingdonshire grew by 5% or 7,400 residents. Within the wards, the highest growth was registered in Yaxley and Farcet, which grew by 1,490 (20% of Huntingdonshire's total growth), St. Neots Eynesbury (1,250 and 17% of total), and Huntingdon West (730 and 10% of total). In the forthcoming 22 years Huntingdonshire's population is forecast to increase by 7%. Most of that increase is forecast to occur in St. Neots Priory Park (48% of total district growth), Alconbury and the Stukeleys (13% of total) and Godmanchester (12% of total) (see Appendix 7 for more details).

Figure 4: Map of Huntingdonshire's population growth by ward, 2009-2031

You will find further population information on our website here:

<http://www.cambridgeshire.gov.uk/business/research/populationresearch/population/>

1.4.1 Migration

Migration is one of the two components of population change – the second is natural change. It consists of inflows (in-migration) and outflows (out-migration) of people. Net migration is the difference between those flows. Each flow is made up of internal (people who live in the UK) and international (people who come to the UK from outside) components.

1.4.2 National

The internal migration portion of the Office for National Statistics (ONS) mid-2009 population estimate for Huntingdonshire¹ suggests that more people *left Huntingdonshire* for other parts of the UK than *came to Huntingdonshire from* other parts of the UK. Net out-migration was approximately 300 people.

Huntingdonshire had the third highest absolute levels of in- and out- internal migration in the County, with Cambridge and South Cambridgeshire first and second respectively; results that reflect the large populations within those districts. South Cambridgeshire experienced the highest net internal in-migration (around 1,400).

1.4.3 International

International migration is extremely difficult to measure. There are currently two data sources used to estimate incoming migration; National Insurance Number (NINo) registrations and registrations for the Workers Registration Scheme (WRS).

NINos are required for employment or self-employment purposes or to claim benefits or tax credits and are allocated to overseas nationals by the Department for Work and Pensions. De-registration is not required, however, which means that NINo figures can only be used to estimate in-migrations. In 2009 approximately 700 people registered for NINos in Huntingdonshire, which is 34% fewer than in 2008. Between 2002 and 2009 the largest proportion (56%) of registrations were Eastern European migrants.

WRS registrations are required by migrants from the so-called A8 countries of Poland, Lithuania, Estonia, the Czech Republic, Slovenia, Latvia, Slovakia and Hungary. The scheme is due to end in April 2011. In 2009 just over 500 WRS registrations were issued in Huntingdonshire, which was marginally fewer than in 2008.

That both NINo and WRS registrations were lower in 2009 than 2008 may indicate that international migration into Huntingdonshire is slowing.

A guide figure for the level of international net-migration can be inferred, however, based on ONS data and the CCCRG estimate. Taking population change in Cambridge between 2008 and 2009 as a base, ONS figures for internal migration and natural change as specified in the CCCRG estimate model can be subtracted from the total change figure.² The remainder indicates the level of net-international migration; approximately 1,200 for Huntingdonshire. **Please note: this figure should be taken as indicative rather than an official estimate.**

For more information on migration within Cambridgeshire please see the CCCRG report on international migration:

<http://www.cambridgeshire.gov.uk/business/research/populationresearch/population/Migration.htm>

1.4.4 Ethnicity

There has been no new data on Huntingdonshire's ethnic diversity since the 2001 Census, the results of which can be found in the Census district profile:

<http://www.cambridgeshire.gov.uk/business/research/populationresearch/census/Districtprofiles.htm>

ONS publish 'experimental' estimates of population by ethnic group which can be downloaded from their website: <http://www.statistics.gov.uk/statbase/product.asp?vlnk=14238>

¹ The internal migration portion is based on NHS data including GP registrations.

² ONS figures are assumed to be accurate here.

1.4.5 Travellers

The population of Travellers and Gypsies is difficult to estimate. Travellers were not identified as an ethnic group in the 2001 Census though this will change in the 2011 Census. The Cambridge Area Travellers Needs Assessment 2005 estimated that in Cambridgeshire and Peterborough there were 6,080 Gypsy/Travellers, making them one of the largest minority ethnic groups in the area.

Recent research on Traveller populations in Cambridgeshire can be found on our website:

<http://www.cambridgeshire.gov.uk/business/research/populationresearch/population/travellersresearch/>

Additional Traveller research can be found on the JSNA website: <http://www.cambridgeshirejsna.org.uk/>

Other reports:

Cambridgeshire County Council Children and Young People Plan:

<http://www.cambridgeshire.gov.uk/childrenyoungpeople/>

The Joint Strategic Needs Assessments (JSNAs) are collaborations between Cambridgeshire County Council and NHS, and includes other partner organisations. JSNAs cover diverse topics such as Children and Young People, Older People, New Communities, Mental Health and Travellers. Reports can be found on the JSNA website: <http://www.cambridgeshirejsna.org.uk/>

2. Households and housing

2.1. Households in Huntingdonshire

In 2001 there were 63,100 households in Huntingdonshire. The estimated number of households in Huntingdonshire in 2009 is 69,300 (see Table 2). That represents a 10% increase since 2001. Households are forecast to increase by 18% from 2009 to 2031. Overall, South Cambridgeshire is expected to experience the highest household growth by 2031 (35%) with Huntingdonshire the lowest (18%). In 2009 Huntingdonshire had the highest proportion of Cambridgeshire's total number households (28%) followed by South Cambridgeshire (24%) and Cambridge City (18%). By 2031 the distribution is forecast to change with South Cambridgeshire and Huntingdonshire each contributing 25% of Cambridgeshire's total households.

Table 2: Household growth in Cambridgeshire and districts, 2001-2031

Area	2001	2009	Change 2001-09	% Change	2031	Change 2009-31	% Change
Cambridge City	42,700	46,000	3,300	7.7%	61,200	15,200	33.0%
East Cambridgeshire	29,900	34,800	4,900	16.4%	45,300	10,500	30.2%
Fenland	35,300	39,900	4,600	13.0%	51,000	11,100	27.8%
Huntingdonshire	63,100	69,300	6,200	9.8%	81,800	12,500	18.0%

Cambridgeshire	223,300	249,800	26,500	11.9%	319,900	70,100	28.1%

Source: CCCRG 2009-based population forecast

2.2. Housing

The CCCRG dwelling stock estimate for Cambridge in 2009 is 70,800.

According to the 2001 census detached houses were the most common type of dwelling, followed by semi-detached (see Figure 5). There are a small number of temporary structures (1%) of all house types and at the time of the census there were also a small number of people in shared accommodation (4%), although it is thought that this has risen as last year there were an estimated 500 Houses in Multiple Occupancy (HMOs), (HSSA, 2009).

Figure 5: Dwelling Stock by Type, 2001

Source: 2001 Census

Figure 6: Average house price and number of sales in Huntingdonshire, 2002-2010

Source: *Hometrack Sales and Valuations (House price) Hometrack Sales only (Sales)*

Huntingdonshire has the second lowest average house price in the county. It has also had one of the largest increases of the last few years – increasing by 84% between 2001 and 2008 (Source: Land Registry). Average house prices are around 6 times average earnings. Lower quartile house prices have been more than 7 times average earnings since 2005, meaning that housing is quite unaffordable for people on lower incomes.

Table 3: Ratio of housing prices to earnings in Huntingdonshire, 2001-2008

	2004	2005	2006	2007	2008
Average	6.2	6.4	7.0	6.7	5.6
Lower Quartile	6.9	7.5	8.0	7.8	7.7

Source: *Land Registry & ASHE*

The number of households on the housing needs register has decreased from 3,400 in 2001, to 3,250 in 2009. Much of this decrease occurred in the earlier years of this period and there has been an increase since 2007. Much of the requirement is for smaller properties with one or two bedrooms (37% and 39% of the total register respectively), (HSSA, 2009).

5,500 homes have been built in the district since 2001, 19% of which are affordable housing completions. Between 2001 and 2009 the percentage of affordable completions has increased from 16% to 32% (See Table 4).

Table 4: Percentage of affordable completions in Huntingdonshire, 2001-2008

	2001/02	2002/03	2003/04	2004/05	2005/06	2006/07	2007/08	2008/09	Total

Source: *CCC Research and Monitoring*

The average cost of buying a home in Huntingdonshire in September 2009 was £205,747 (Source: Hometrack) – around £24,440 cheaper than the average for the county as a whole.

2.2.1 House building

In past years, local authority house building targets have been laid out in the East of England Plan (the Regional Spatial Strategy (RSS)). During 2009 and the early part of 2010, work was underway to review the RSS and roll it forward to 2031. On 12th March 2010, the Regional Assembly approved the draft East of England Plan > 2031, which set out a revised set of Policy H1 house-building targets for the local authorities making up the Eastern Region.

Following the General Election, however, the incoming Communities and Local Government Secretary, Eric Pickles, announced his intention to abolish RSS, a move that left a vacuum in local authority housing policy. Therefore there are currently no official housing targets. However, if the Policy H1 targets are taken as a guide, and the phasing of building is based on house building trajectories laid out in district councils' December Annual Monitoring Reports (AMRs), then a dwellings forecast to 2031 may be constructed (see Table 5).

Table 5: Dwellings forecast for Cambridgeshire and districts, 2009-2031

Area	Interim building 2010-2011	Policy H1: Regional Housing Provision 2011-2031	Total 2009- 2031
Cambridge City	1,050	14,000	15,050
East Cambridgeshire	600	11,000	11,600
Fenland	800	11,000	11,800
Huntingdonshire	1,650	11,000	12,650
South Cambridgeshire	1,450	21,000	22,450
Cambridgeshire	5,550	68,000	73,550

Source: CCCRG 2009-based population and dwelling stock forecast methodology

It is likely, however, that these figures are optimistic, especially for Cambridge and South Cambridgeshire. For a full discussion of CCCRG 2009-based dwellings forecasts, please see the forecasts methodology document in Appendix 4. For a detailed breakdown of forecast house building by district and ward, please see our web pages:

<http://www.cambridgeshire.gov.uk/business/research/populationresearch/population/forecasts/>

Cambridgeshire Horizons Strategic Housing Market Assessment (SHMA):

http://www.cambridgeshirehorizons.co.uk/our_challenge/housing/shma.aspx

Huntingdonshire Housing Strategy:

<http://www.huntingdonshire.gov.uk/Housing/Housing%20Strategy%20and%20Policy/Pages/default.aspx>

3. Economy

3.1. The labour market in Huntingdonshire

According to the ONS Annual Population Survey (APS) 66% of Huntingdonshire's population is aged 16 to 64 (working age), just above the national figure of 65%. 80% of the population aged 16-64 is economically active (working or seeking work), above the national figure of 77%.

According to 2008 Jobs Density figures, Huntingdonshire's labour demand is not as high as its available workforce, with 84,000 jobs in 2008 and a jobs-to-population aged 16-64 ratio of 0.78.

The latest jobs data for Cambridgeshire wards and districts can be found in the Cambridgeshire Ward Atlas available at: <http://map1.cambridgeshire.gov.uk/observe/Flash/Profiles/WardProfiles/atlas.html>.

The APS gives a wide measure of unemployment, which complies with the International Labour Office (ILO) definition. It includes people seeking work whether or not they are eligible for Jobseeker's Allowance (JSA). The June 2010 figure for the district's unemployment rate is 6.2% (% of economically active people aged 16 and over), while the England figure on that basis is 7.7%.³

The narrow rate, claimant unemployment, for Huntingdonshire is also below both the national and East of England figures. In December 2010, rates of Jobseeker's Allowance (JSA) claimants (% of all people aged 16 to 64) were Huntingdonshire, 2.0%; East of England, 2.8%; and England, 3.5% (see Table 6).

Table 6: Claimant Count Unemployment Rates, December 2010

Area	All	Male	Female
Cambridge	1.80%	2.50%	1.00%
East Cambridgeshire	1.70%	2.50%	1.00%
Fenland	3.40%	4.70%	2.20%
Huntingdonshire	2.00%	2.80%	1.30%
South Cambridgeshire	1.40%	1.90%	0.80%
Cambridgeshire	2.00%	2.70%	1.20%
East of England	2.80%	3.90%	1.80%
England	3.50%	4.80%	2.10%

Source: *Claimant Count*, NOMIS

Rates of JSA claimants in Huntingdonshire in December 2010 were lower than in December 2009 by 0.5 percentage points and lower than in November 2010 by 0.1 percentage points (see Figure 7 below).

Rates of Out-of-Work Benefits claimants (% of all people aged 16 to 64) in Huntingdonshire in May 2010 were lower than in May 2009 by 0.2 percentage points, according to DWP Benefits figures, with 7.3%, or 7,850 people, in May 2010, compared to 7.5%, or 8,100 people, in May 2009.

The latest benefits data for Cambridgeshire wards and districts can be found in the Cambridgeshire Ward Atlas available at: <http://map1.cambridgeshire.gov.uk/observe/Flash/Profiles/WardProfiles/atlas.html>.

³ The figure for Huntingdonshire is the model-based estimate of unemployment produced by ONS, as the Annual Population Survey does not have a sufficiently large sample to provide precise estimates of unemployment for local authorities.

Figure 7: Claimant Count Unemployment Rates, December 2007 to December 2010

Source: *Claimant Count, NOMIS*

According to the 2010 Annual Survey of Hours and Earnings, women working full-time in Huntingdonshire earn less than their male counterparts. As Table 7 indicates, the workplace-based median full-time gross weekly earnings figures for employees for 2010 showed that men earned an average of £531.9 per week and women an average of £442.2. Overall, people working full-time in Huntingdonshire earn just below the national weekly average.

Table 7: Median Full-time Gross Weekly Earnings, April 2010

Area	All	Male	Female
Cambridge	£539.2	£574.9	£481.5
East Cambridgeshire	£442.2	£483.4	£368.7
Fenland	£399.1	£429.7	£364.7
Huntingdonshire	£503.6	£531.9	£442.2
South Cambridgeshire	£599.9	£670.8	£488.8
Cambridgeshire	£520.3	£561.9	£466.1
East of England	£488.7	£535.0	£424.4
England	£504.5	£546.2	£442.2

Source: *Annual Survey of Hours and Earnings – Workplace Analysis, NOMIS*

Occupation figures from the June 2010 APS indicate that 33% of the employed residents of Huntingdonshire are in managerial and professional occupations, compared to a national figure of 30%. Industry participation figures show that 26% work in production and construction, compared to a national figure of 21%, and 74% work in service industries.

3.2. Businesses in Huntingdonshire

The annual ONS publication, UK Business: Activity, Size and Location, presents a snapshot of businesses in the UK as at March of each year. It contains detailed information on all businesses in the UK including size, classification and location. The 2010 edition was compiled from a snapshot of the Inter Departmental Business Register (IDBR) taken on 22 March 2010. It is available free on the National Statistics website:

<http://www.statistics.gov.uk/StatBase/Product.asp?vlnk=933> for years from 1995 onwards.

The IDBR combines ONS survey data with administrative information on VAT (Value Added Tax) traders and PAYE (Pay As You Earn) employers in a statistical register comprising 2.1 million businesses, representing nearly 99% of UK economic activity. The IDBR misses some very small businesses without VAT or PAYE schemes (self employed and those with low turnover and without employees). The National Statistics Quality Review of the IDBR found it to be among the leading statistical business registers in the world.

The geographical locations and industrial classifications of business activity on the IDBR are determined from responses to surveys, or from administrative data held in VAT and PAYE schemes. The IDBR contains information at both Enterprise and Local Unit (site) level. An individual site (for example a factory or shop) in an enterprise is called a local unit. Where an enterprise has several local units, the location of the enterprise is generally the main operating site or the head office. The following table presents data for VAT and/or PAYE based local units from UK Business 2010.

Table 8: Number of Local Units in Huntingdonshire by Size and Sector in 2010

<i>Employment Size</i>	<i>Local Units</i>
0 – 4	5,470
5 – 9	1,115
10 – 19	530
20 – 49	420
50 – 99	120
100 – 249	75
250 – 499	15
500 – 999	5
1,000 +	5
TOTAL	7,755

<i>Industry Sector</i>	<i>Local Units</i>
Agriculture, forestry & fishing	510
Production	565
Construction	920
Motor trades	245
Wholesale	455
Retail	670
Transport & storage (inc. postal)	305
Accommodation & food services	370
Information & communication	575
Finance & insurance	150
Property	225
Professional, scientific & technical	1,140
Business administration and support services	550
Public administration and defence	80
Education	190
Health	310
Arts, entertainment, recreation and other services	495
TOTAL	7,755

Source: *UK Business: Activity, Size and Location – 2010*, ONS

In 2010 there were 7,755 local units in VAT and/or PAYE based enterprises in Huntingdonshire. Table 8 shows the distribution of businesses by employment size and industry sector. The professional, scientific and technical sector accounts for the largest number of businesses with 15% of all local units. Analysis by size shows that 85% of businesses employed fewer than ten people, and 97% employed fewer than 50.

3.3. Local economic assessment

Following the publication of the Local Democracy, Economic Development and Construction Act, upper tier local authorities now have a duty to undertake an Economic Assessment of their local area from April 2010. Cambridgeshire County Council has coordinated the development of Cambridgeshire's Economic Assessment working in partnership with local district councils and the Greater Cambridge Partnership. As a shared evidence base, the economic assessment highlights the most important economic issues facing the county and districts, and offers a comprehensive view of Cambridgeshire's economy and functional economic area.

The economic assessment shows Cambridgeshire to have a diverse, relatively resilient economy with nationally significant strengths in research and development, higher education, software consultancy, high value engineering and manufacturing, creative industries, pharmaceuticals, agriculture, processing and tourism. Many of these sectors are recognised to have significant growth potential which bodes well for the future health of the economy. Much of the resident population is highly skilled, levels of economic activity are high, crime levels are low and generally residents are satisfied with the area as a place to live. However, the gap in prosperity and skills between the north of the county and the south of the county is growing, women earn significantly less than men and transport congestion costs businesses millions in lost productivity. Low housing affordability and inadequate broadband access may severely restrict the capacity of the economy to grow and high carbon emissions will increase the vulnerability of business and residents to future hikes in energy prices.

Cambridgeshire's labour market is relatively self contained, with 80% of Cambridgeshire's residents working in the county, and 81% of Cambridgeshire's workers living in the county. These figures have not changed significantly since 2001, however there has been a slight increase in the number of residents commuting to London, mainly from South Cambridgeshire and Huntingdonshire. Cambridge acts as a regional centre of employment. Commuting patterns into Cambridge stretch across the Cambridgeshire local authority boundary into the surrounding districts of St Edmundsbury, Forest Heath and Uttlesford. These patterns overlap significantly with those of Peterborough. Analysis has therefore been undertaken at the level of the functional economic area (Greater Cambridge), county and district with comparisons taken at regional and national level.

The economic assessment is available at:

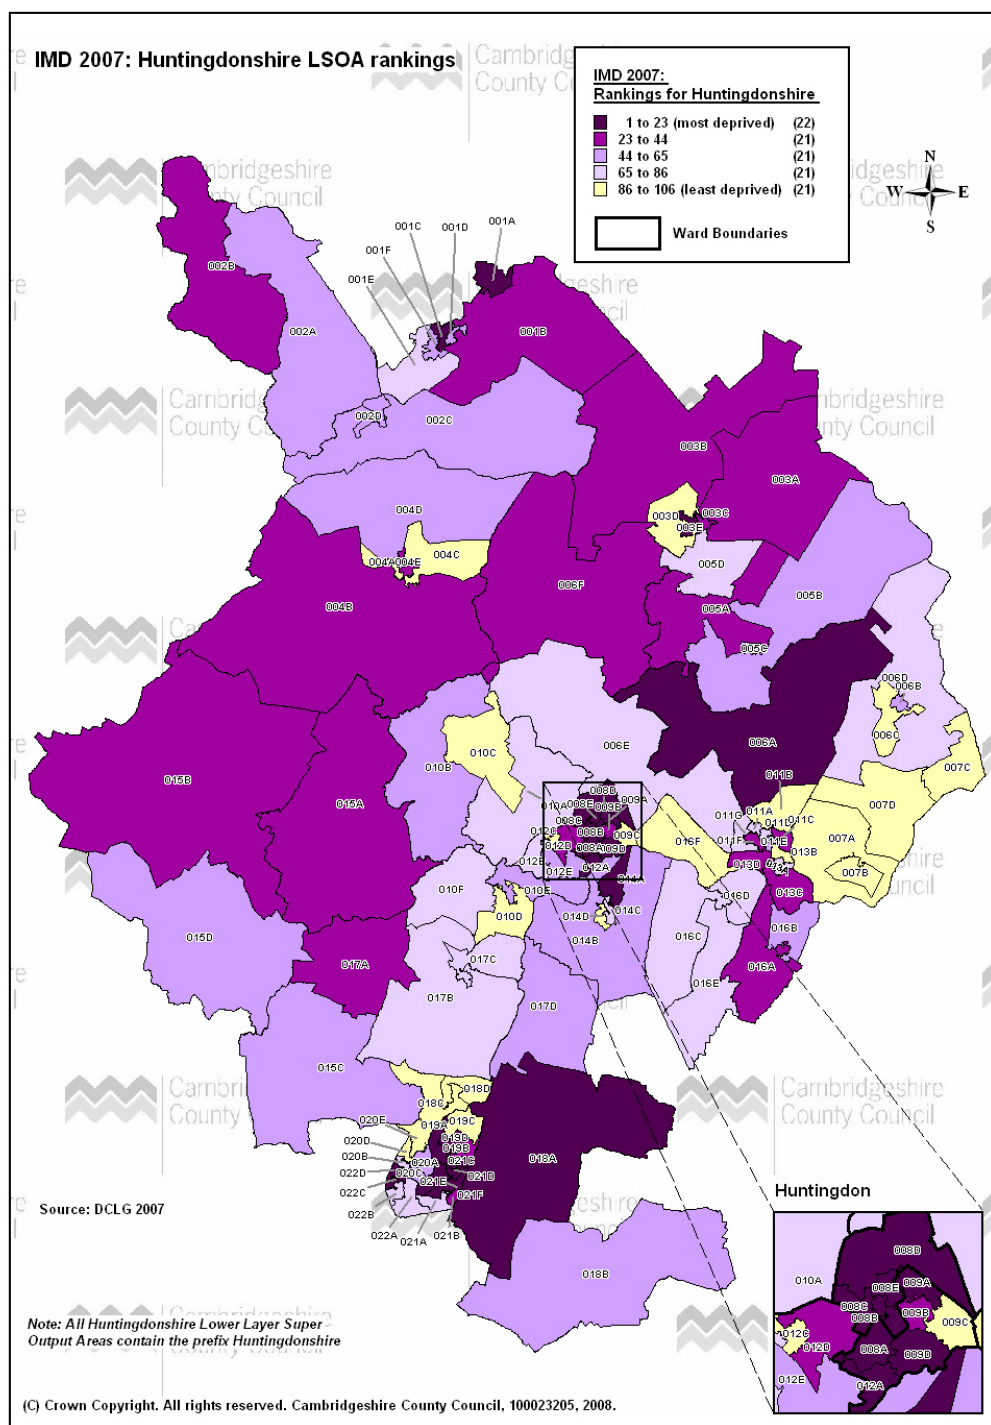

<http://www.cambridgeshire.gov.uk/business/economicandcommunitydev/ecodevelopment/economicassessment.htm>

3.4. Economic well-being and deprivation

CCCRG has done extensive analysis of the Indices of Deprivation 2007 (ID 2007), including mapping data to areas smaller than wards – Lower Super Output Areas (LSOAs; each LSOA contains on average 1500 residents). Two reports, *Deprivation in Cambridgeshire - Index of Multiple Deprivation 2007* and *Deprivation in Cambridgeshire - Individual Indices of Deprivation 2007*, are major resources for all partners. The first report presents data on the overall Index of Multiple Deprivation (IMD), and the second includes full details of deprivation on the seven separate domains: income; employment; health and disability; education, skills and training; barriers to housing and services; living environment; and crime. There is also analysis of income deprivation affecting children and income deprivation affecting older people. The reports present results in district, county, regional and national contexts.

Huntingdonshire is the second least deprived district in Cambridgeshire after South Cambridgeshire. Its average IMD score places it at 311 among 354 local authorities (districts and unitary authorities) in England (where 1 indicates the most deprived and 354 the least deprived), which suggests that Huntingdonshire is considerably less deprived than other areas nationally. However, it has some pockets of deprivation that are concentrated in market towns (see Figure 8 below).

Figure 8: Huntingdonshire indices of multiple deprivation, 2007

Both reports are available on our website:

<http://www.cambridgeshire.gov.uk/business/research/economylab/deprivation/IMD2007.htm>

Also available is data on the Economic Deprivation Index 2008:

<http://www.cambridgeshire.gov.uk/business/research/economylab/deprivation/The+Economic+Deprivation+Index+2008.htm>

And the Local Index of Child Wellbeing 2009:

<http://www.cambridgeshire.gov.uk/business/research/economylab/deprivation/Local+Index+of+Child+Well-Being+2009.htm>

In addition to written reports, much of the data is presented in interactive maps linked to our web pages.

<http://www.cambridgeshire.gov.uk/business/research/researchmaps.htm>

4. Health

4.1. General health information

The following section includes summary measures of health and health status for Huntingdonshire. It reviews data from a number of sources and drawn from varying data releases from the ONS.

4.1.1 Joint Strategic Needs Assessment

Comprehensive analysis of the health and well-being status and needs of the Cambridgeshire population for different population groups is provided in the Joint Strategic Needs Assessment (JSNA). Information in the documents is available at different administrative, geographic and statistical levels, including district council level, as well as ONS 'clusters'.⁴ So far, in four phases of the JSNA work, the following population groups have been included:

- Children and young people
- Older people, including dementia
- Adults of working age, including mental health
- Adults with a learning disability
- Adults with a physical disability or sensory impairment and/or long term conditions
- People who are homeless or at risk of homelessness
- Migrant workers
- Travellers
- New Communities

The JSNA documents and information is available from a dedicated Cambridgeshire JSNA website at: <http://www.cambridgeshirejsna.org.uk>

4.2. Health status of the Huntingdonshire population

The health of people in Huntingdonshire is generally significantly better than the England average. However, there are inequalities within the district. Men from the least deprived areas can expect to live about 5 years longer than those from the most deprived areas; in women this difference is 1 year. More information is available from "Huntingdonshire Health Profile 2010" by Association of Public Health Observatories (APHO) at: <http://www.apho.org.uk>

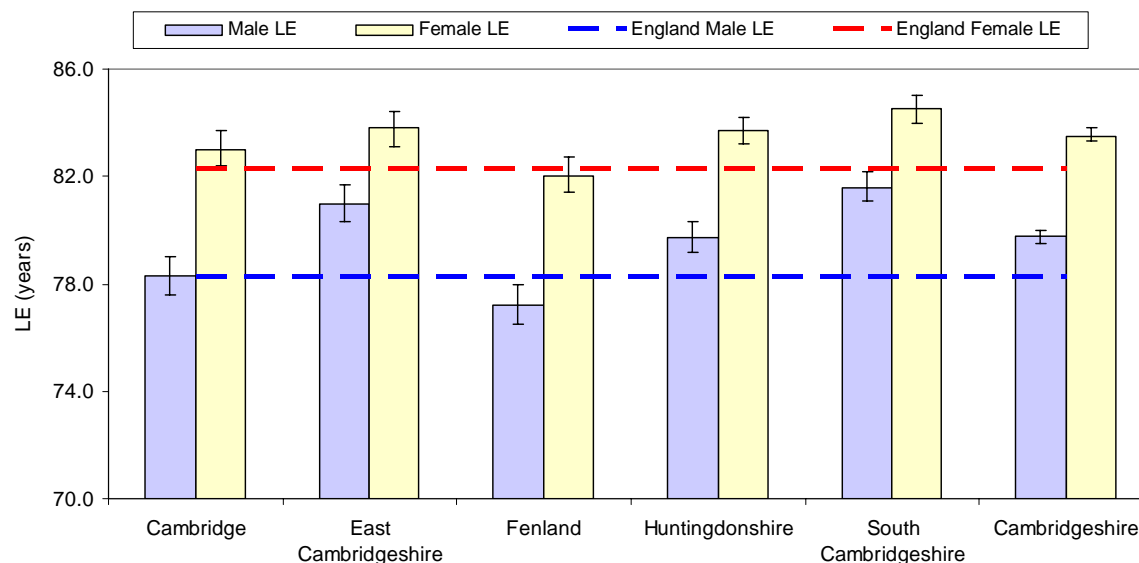

The NHS Cambridgeshire Cluster Dataset 2010 indicates that the health of the Huntingdonshire population is similar to its ONS cluster (an area that is similar in terms of demographic and socio-economic features) – Prospering Smaller Towns. Road injuries and deaths as well as mortality from land based traffic accidents are significantly worse for Huntingdonshire compared to the national and cluster average, which suggests that this is an issue in the district. More information is available from "Joint Strategic Needs Assessment Phase 4 Summary. Appendix A: NHS Cambridgeshire Cluster Dataset 2010" at: <http://www.cambridgeshirejsna.org.uk>.

4.3. Life expectancy at birth

Men born in Huntingdonshire in 2007-2009 can expect to live 79.7 years, which is significantly higher than in England (78.3) and at a similar level as in Cambridgeshire (79.8 years). Women in Huntingdonshire can expect to live 83.7 years, which is significantly higher than in England (82.3 years). Data are shown in Figure 9.

⁴ Clusters are areas that are similar in terms of demographic and socio-economic features.

Figure 9: Male and female life expectancy at birth (years) in Cambridgeshire and England, 2007-2009

Source: Office for National Statistics (ONS), Life expectancy at birth in the UK 2007-09, October 2010 (<http://www.statistics.gov.uk/StatBase/Product.asp?vlnk=8841>)

NOTES: Please note confidence intervals: if they do not overlap with the dashed lines marking average life expectancy in England, it indicates a statistically significant difference.

Trends in male and female life expectancy in Huntingdonshire compared to England in the period from 1991-1993 to 2006-08 are shown in Figure 10. During the whole period life expectancy both in males and in females was higher in Huntingdonshire than in England.

Figure 10: Life expectancy at birth in Huntingdonshire and England, 1991-93 to 2007-2009

Source: Office for National Statistics (ONS), Life expectancy at birth (years), United Kingdom, males and females, 1991-1993 to 2007-2009, October 2010 (<http://www.statistics.gov.uk/StatBase/Product.asp?vlnk=8841>)

4.4. Main causes of death

Huntingdonshire has rates of mortality from all causes that are significantly lower than in England and Cambridgeshire but the difference in directly age-standardised rates (DSR)⁵ is not statistically significant. The data are in Table 9.

Table 9: All causes of death in people of all ages, Local Authorities, 2007-2009

Local Authority	Number of deaths 2007-2009	Directly age-standardised rates (DSR) per 100,000 population	95% confidence limits	
			Lower CI	Upper CI
England	1,405,724	567	566	568
Cambridgeshire	14,476	505	496	514
Cambridge	2,527	551	527	575
East Cambridgeshire	2,023	475	454	498
Fenland	3,077	590	568	613
Huntingdonshire	3,699	501	484	518
South Cambridgeshire	3,150	445	429	462

Source: East of England Public Health Observatory, 2011

Definition: All age, all cause mortality: Directly standardised rates and counts with 95% confidence intervals.

Mortality from circulatory diseases (including heart disease and stroke) in people in Huntingdonshire is significantly lower than in England. The same is true for the cancer mortality.⁶

Figure 11 shows the proportion of deaths for selected causes of death in Huntingdonshire among the resident population. The most common cause of death is circulatory disease and cancer each at 30% of all deaths.

Figure 11: Proportion of deaths for selected causes of mortality in Huntingdonshire, 2009

Source: ONS Vital Statistics (VS3) tables, 2010

4.5. Healthy lifestyles

Adult smoking is estimated to be significantly lower in Huntingdonshire (19%) than in England (22%). Only in one of the district's areas: Huntingdonshire North smoking is estimated to be significantly higher than seen

⁵ Age standardised rates are used to eliminate the impact of age distributions when comparing populations. Direct age-standardisation is used to compare common outcomes in large populations. When comparing small population or rare outcomes a method of indirect standardisation is used.

⁶ Figures for both can be found at: <http://www.erpho.org.uk/>

nationally. Obesity is estimated to be at a similar level in Huntingdonshire as it is in England (24%); the same is true for the consumption of five or more portions of fruits or vegetables a day (31% of adult population in Huntingdonshire and 29% in England). The prevalence of binge drinking in the district (16%) is lower than in England (20%). Detailed information about the lifestyle behaviours synthetic estimates based on 2006-2008 data is available from APHO at: <http://www.apho.org.uk>.

4.6. Child obesity

The prevalence of overweight Reception age and Year 6 children in Huntingdonshire is not significantly different from the prevalence in England. The same is true for the prevalence of obesity in Reception children. However, prevalence of obesity in Year 6 children is significantly lower in Huntingdonshire (15%) than seen nationally (19%). The data are in Table 10.

Table 10: Child obesity for local authorities, GOR, and country, 2010

Area	Overweight				Obese			
	Reception		Year 6		Reception		Year 6	
	95% confidence interval ±		95% confidence interval ±		95% confidence interval ±		95% confidence interval ±	
	Prevalence		Prevalence		Prevalence		Prevalence	
England	13.3%	0.1%	14.6%	0.1%	9.8%	0.1%	18.7%	0.1%
Cambridgeshire	12.7%	0.9%	14.3%	0.9%	8.7%	0.7%	15.6%	1.0%
Cambridge	13.0%	2.2%	14.1%	2.4%	8.7%	1.8%	14.6%	2.5%
East Cambridgeshire	11.3%	2.1%	13.8%	2.4%	9.7%	2.0%	17.3%	2.6%
Fenland	13.1%	2.2%	14.3%	2.2%	10.3%	2.0%	19.7%	2.5%
Huntingdonshire	12.3%	1.6%	15.0%	1.7%	8.8%	1.4%	14.6%	1.7%
South Cambridgeshire	13.3%	1.7%	13.9%	1.8%	7.1%	1.3%	13.5%	1.8%

Source: *National Child Measurement Programme England, 2009/10*; <http://www.ic.nhs.uk/ncmp>

See also <http://www.cambridgeshire.gov.uk/childrenyoungpeople/childrentrust/> and <http://www.cambridgeshirejsna.org.uk/children-and-young-people/children-and-young-people>

4.7. Teenage conceptions

The teenage conception rate in Huntingdonshire is significantly lower than England's rate but at a similar level to the county, based on 2006-2008 data. The data are in Table 11. In some areas (in Huntingdon and St Neots) the rate is significantly higher. See the Cambridgeshire ward profiles for more data: <http://www.cambridgeshire.gov.uk/business/research/researchmaps.htm>

Table 11: Teenage conception for local authorities, GOR, and country, 2006-2008

Area	Total conceptions (2006-08)	Rate per 1,000 (2006-08)	95% CI	% change in rate 1998/00-2006/08
England	118,286	41	(40.7 - 41.1)	-9.1%
East of England	10,417	33	(32.0 - 33.2)	-10.6%
Cambridge	156	29	(24.5 - 33.4)	-13.5%
East Cambridgeshire	89	21	(16.9 - 25.4)	-29.4%
Fenland	188	38	(33.0 - 43.7)	-27.5%
Huntingdonshire	260	27	(23.9 - 30.4)	-7.4%
South Cambridgeshire	136	18	(15.1 - 21.0)	3.2%
Cambridgeshire	829	26	(24.3 - 27.8)	-13.6%

Source: *Office for National Statistics and Teenage Pregnancy Unit*

Definition: *ONS estimates of conceptions in girls aged under 18. Rates are per 1,000 female population aged 15-17 years.*

More information about the health of children and young people in Cambridgeshire can be found in 'Data Profile of Children and Young People in Cambridgeshire' at:

5. Community safety

Cambridgeshire has five Community Safety Partnerships (CSP); one in each district. Each partnership has a statutory duty to reduce crime and disorder in its area. Each CSP has a statutory duty to reduce crime and disorder in its area. Huntingdonshire District Council plays an active role in the district's CSP, which also includes representatives from the Police, County Council, PCT and Probation. The Partnership also considers wider issues surrounding drug and alcohol misuse, the importance of the positive involvement of young people in the community, and the role that the Neighbourhood Panels will be able to play in dealing with community issues. A strategic assessment of the district's progress with regards to patterns of crime and disorder is carried out annually, copies of which can be downloaded at:

<http://www.cambridgeshire.gov.uk/business/research/rescrime/>

This process helps to inform the district's targets and priorities for the coming year, feeding into the Community Safety Plan, which can be found here:

<http://www.huntingdonshire.gov.uk/Community%20and%20People/Crime%20and%20disorder/Huntingdonshire%20Community%20Safety%20Partnership/Pages/Huntingdonshire%20Community%20Safety%20Plan%202008-2011.aspx>

5.1. Overview

Countywide, crime has decreased by 7% in 2010 compared to 2009 (Jan-Dec). Figure 12 shows that crime levels in Huntingdonshire have also continued to decline, albeit at a slower rate of 3%. Looking back, at crime in Huntingdonshire between 2007 and 2010, there has been a reduction in crime from 9,600 crimes to 8,887 a decrease of 7%.

Figure 12: Monthly crime count for Huntingdonshire, 2007-2010

Source: Cambridgeshire Constabulary, Corporate Performance Department

Table 12 shows changes in record crime over the past 12 months by district:

Table 12: Total police recorded crime by CDRP area

<i>District</i>	<i>Jan - Dec 09</i>	<i>Jan - Dec 10</i>	<i>% change</i>
Cambridge City	14,868	13,806	-7%
East Cambridgeshire	3,573	3,346	-6%
Fenland	6,931	6,636	-4%
Huntingdonshire	9,151	8,887	-3%
South Cambridgeshire	6,243	5,257	-16%
Cambridgeshire County	40,766	37,932	-7%

Source: Cambridgeshire Constabulary, Corporate Performance Department

Not all areas of crime in Huntingdonshire have improved. Increases have been noted in:

- Violent crime
- Aggravated vehicle taking

Decreases have been seen in:

- Arson
- Dwelling burglaries

Table 13 outlines the counts of police-recorded crime within Huntingdonshire for 2010 and 2009.⁷ It is important to note that while percentage changes may be significant, in many cases total change is minimal.

Table 13: Police recorded crime figures for Huntingdonshire

<i>Crime Type</i>	<i>Jan - Dec 2009</i>	<i>Jan - Dec 2010</i>	<i>Change</i>	<i>% change</i>
All Crime	9,151	8,887	-264	-2.9%
Serious Acquisitive Crime	1,635	1,369	-266	-16.3%
Burglary Dwelling	765	524	-241	-31.5%
All Vehicle Crime	817	799	-18	-2.2%
Aggravated Vehicle Taking	15	22	7	46.7%
Most Serious Violence	87	75	-12	-13.8%
Wounding Endangering Life	43	55	12	27.9%
Assaults With Less Serious Injury	583	625	42	7.2%

⁷ Crime types are defined by the Home Office: <http://rds.homeoffice.gov.uk/rds/countrules.html>

Within Huntingdonshire, for the majority of crime types there has been a significant improvement. The Strategic Assessment offender data for the period April and July 2010 shows that 24% of offenders across Cambridgeshire came from Huntingdonshire. In comparison to the total population, minority ethnic groups are over-represented within the offender community. 82% are male, and the highest number reside within the Huntingdon West ward. The most common crime is violent crime (35%) followed by fraud and forgery crimes (20%).

The average violent crime offender was male, aged in their early 20s (slightly younger than those from other districts) white, and single. Drug misuse problems and issues with relationships and general decision-making behaviour were common. Violent crime and theft and handling offenders were typically older, with an average age of just over 28 years for each crime type. The majority of drugs offences recorded between April and July 2010 were related to cannabis use.

Figure 13 examines set crime types considered to be of concern in the area over the longer term. The decrease in theft & handling incidents is most apparent, as is the slight decrease in criminal damage counts. Dwelling burglary incidents are of particular concern because, despite occurring less often than other crime types, the cost of the crime – both financially and emotionally – is significantly higher.

6. Education

6.1. School pupils

6.1.1 Early years foundation stage profile

The Early Years Foundation Stage Profile (EYPS) assesses the achievement of children at the end of the Foundation Stage (age 5) against 13 assessment scales, which are grouped into six areas of learning. Table 14 shows the current results for Cambridgeshire for each assessment scale by area of learning. The children included in these results are only those in receipt of a government funded early education place at the end of the Foundation Stage.⁸ In Cambridgeshire, the majority of children are working securely within the early learning goals, closely reflecting the results of England as a whole. Overall, 55% of children in Cambridgeshire achieved a good level of development in 2010.⁹ For more information please see:

<http://www.education.gov.uk/rsgateway/DB/SFR/s000961/index.shtml>

Further information about the EYPS profile can be found at:

<http://www.education.gov.uk/childrenandyoungpeople/earlylearningandchildcare>.

Table 14: Percentage of children achieving six points or more for each assessment scale, 2010

<i>Learning Area</i>	<i>Cambridgeshire</i>	<i>England</i>
Personal, social, and emotional development

(URL: <http://www.education.gov.uk/rsgateway/DB/SFR/s000961/index.shtml>)

6.1.2 Key stage 2 results

Tasks and tests in English and Maths are taken at the end of Key Stage 2 by pupils aged 11+. The expected level of performance is Level 4. Key Stage 2 Science tests were replaced by teacher assessments and

⁸ Local authorities are legally required to secure a free Government-funded early education place (currently for 12.5 hours per week over a minimum of 38 weeks per year) for every three and four year old in their area. This entitlement is to be extended to 15 hours per week by September 2010.

⁹ A good level of development is defined as a score of 78 points or more across the Early Years Foundation Stage, and 6 points or more in each of the seven scales in personal, social and emotional development, and communication, language and literacy.

sampling tests in 2009. The latter are administered to 5% of all maintained schools, providing an estimate of national attainment. Science results are therefore excluded from this report.

Performance in Key Stage 2 English and Maths varies across Cambridgeshire, with a trend over the last five years for schools in Fenland and East Cambridgeshire to score below the County average in the two subjects, while schools in South Cambridgeshire score above, and Cambridge City and Huntingdonshire fluctuate around the County average.

6.1.3 English

English results in Huntingdonshire have been declining since 2007 and are currently at the County average, with 80% of pupils gaining Level 4 or above in Key Stage 2 English.

6.1.4 Maths

The percentage of pupils gaining Level 4 or above in Key Stage 2 Maths has remained at around 80% for the last five years in Huntingdonshire. This is above the County average, with the exception of 2008.

Figures 14 and 15 show the percentage of pupils gaining Level 4 or above in Key Stage 2 English and Maths, in all schools by district and for the Cambridgeshire County average.

Figure 14: Percentage of Pupils Gaining Level 4 or above in Key Stage 2 English, 2006-2010

Source: DCSF, *National Curriculum Assessments at Key Stage 2 in England, Statistical First Release (Revised)*, 2005/06-2009/10. Data by district of school location. (URL: <http://www.education.gov.uk/rsgateway/whatsnew.shtml>)

Figure 15: Percentage of Pupils Gaining Level 4 or above in Key Stage 2 Maths, 2006-2010

6.1.5 GCSE performance

While all districts in Cambridgeshire have seen a rise in the percentage of pupils gaining 5 or more A*-C grades, GCSE performance varies across the County. In Fenland and parts of Cambridge City the trend has been to achieve scores below the County average, while South Cambridgeshire has had scores above the County average. Schools in Huntingdonshire continue to achieve just below the County average. Over the last five years the percentage of pupils gaining 5 or more A*-C grades in Huntingdonshire has been increasing steadily from 59% to 75%.

Figure 16 shows the percentage of pupils gaining 5 or more A*-C grades in mainstream secondary schools. It does not include pupils in Special Schools or Pupil Referral Units.

Figure 16: Pupils Gaining 5 or more A*-C grades in mainstream secondary schools, 2006-2010

Source: DCSF, *GCSE and Equivalent Results in England, Statistical First Release (Revised)*, 2005/06-2009/10. Data by district of school location. (URL: <http://www.education.gov.uk/rsgateway/whatsnew.shtml>)

Summaries of both Key Stage 2 and GCSE results for Cambridgeshire's wards and districts can also be found at: <http://www.education.gov.uk/inyourarea/>.

Results by schools can be found here: <http://www.dcsf.gov.uk/performance/tables/index.shtml>

6.2. School leavers

In 2010 there were 1,776 Year 11 school leavers from mainstream schools in Huntingdonshire. Of these, almost 90% remained in full time education. There was a large variation in the percentage of pupils that remained in full time education and the secondary school they had attended. The highest rate was from Hinchbrook School (94%), which is one of the highest in the County. The lowest rate was from St Peter's School (83%) which is also the lowest in the County.

As of 1st November 2010, 0.2% of all Huntingdonshire school leavers were in full time training, while 4.3% were in full time employment (Figures 17 & 18). The most popular occupations of pupils coming from Huntingdonshire schools were: motor vehicles (18%) and engineering including electronic/electrical (18%) for males, and hairdressing and beauty (38%) and retail (19%) for females. At a County level the most popular occupations were: engineering (21%), construction (16%) and motor vehicle (11%) for males, and hairdressing and beauty (37%), retail (14%), and catering (12%) for females.

2.4% of leavers were not in education, employment or training (NEET) but were actively seeking one of the three. 3.5% have either moved, their status was unknown or they were involved in other activities such as voluntary or part time work.

Table 15 shows destinations of Year 11 school leavers in all districts in Cambridgeshire. It can be noted that Cambridge City is the district with the highest percentage of Year 11 school leavers in full time education.

Further information can be found at:

<http://www.cambridgeshire.gov.uk/childrenyoungpeople/connexions/parents/destinations.htm>

Table 15: Destinations of Year 11 school leavers in Cambridgeshire, 2010

<i>Destination</i>	<i>Cambridge City</i>	<i>East Cambs</i>	<i>Fenland</i>	<i>Hunts</i>	<i>South Cambs</i>	<i>County</i>
Full time education	93.1%	90.5%	90.9%	89.6%	92.7%	91.2%
Full time training	0.5%	1.3%	1.7%	0.2%	0.6%	0.7%

7. Environment

7.1. CO₂ Emissions

In 2008 Huntingdonshire had CO₂ emissions of 1775 kilotonne (kt), which was a 3% reduction on the 2007 figure. This accounted for 29% of the total CO₂ emissions for Cambridgeshire. Huntingdonshire had the third lowest rate of CO₂ emissions per capita, at 10.7 tonnes per person (see Table 16). Huntingdonshire's overall reduction in emissions comes from significant falls in industrial and commercial emissions between 2005 and 2008 (87 kt or 14%). While domestic and LULUCF¹⁰ emissions have also declined, but road transport emissions have increased since 2005.

Table 16: District estimates carbon emissions by end user, summary 2008

Area	Industry and Commercial	Domestic	Road Transport	LULUCF*	Total	Population ('000s, mid-year estimate)	Per Capita Emissions (t)
Cambridge	436.6	236.3	109.0	0.2	782.1	118.7	6.6
East Cambridgeshire	193.7	187.8	261.6	158.7	801.7	82.6	9.7
Fenland	473.1	222.8	189.3	151.2	1,036.3	91.6	11.3
Huntingdonshire	518.2	385.2	736.4	135.1	1,774.9	165.2	10.7
South Cambridgeshire	729.1	348.7	643.1	18.2	1,739.0	142.4	12.2
Cambridgeshire	2,350.6	1,380.6	1,939.3	463.4	6,133.9	600.6	10.2

Totals may not sum due to rounding

* Land use, land use change and forestry

For full national data sets please visit the DEFRA website:

http://www.decc.gov.uk/en/content/cms/statistics/climate_change/data/data.aspx

7.2. Air Quality

Air quality is primarily measured in concentrations of nitrogen dioxide and fine particles. These pollutants are monitored at a range of sites around Huntingdonshire.

7.2.1 Nitrogen dioxide

Nitrogen dioxide (NO₂) is an acid gas and ozone pre-cursor, which can badly affect human health, vegetation, and buildings. It is present from the high temperature combustion of fossil fuels, generally derived from road traffic and industry and is thought to have both acute and chronic effects on airways and lung function, which can in turn lower resistance to respiratory infections. Health effects are only observed at higher concentrations. Automatic NO₂ monitoring currently occurs only at Grafham Water from a mobile monitoring unit. A site at Pathfinder House was decommissioned in 2008 but is due to be re-established. A third site, at Brampton, was under discussion in response to the proposed A14 upgrade. In addition, Huntingdonshire District Council maintains 32 diffusion tube monitoring sites around the district.

A summary of the diffusion tube and automatic monitoring can be found in the [Huntingdonshire District Council Air Quality Progress Report 2010](#), see pages 22-25.

¹⁰ Land use, land use change and forestry.

7.2.2 Fine particles

Other sources of air pollution are the so-called fine particles, which are composed of a wide range of materials arising from sources such as: combustion (mainly road traffic); secondary particles, mainly sulphate and nitrate formed by chemical reactions in the atmosphere; coarse particles, suspended soils and dusts, sea salt, biological particles and particles from construction work. Fine particles can be carried deep into the lungs where they can cause inflammation and a worsening of the condition of people with heart and lung diseases.

Particles are measured in a number of different size fractions according to their mean aerodynamic diameter. Most monitoring is currently focused on PM₁₀, but the finer fractions such as PM_{2.5} and PM₁ are of increasing interest. PM₁₀ are measured 10µm (10 thousandths of a millimetre) in diameter or smaller. As with NO₂, PM₁₀ is currently only monitored through the Grafham Water mobile unit.

Monitoring results can be found in the [Huntingdonshire District Council Air Quality Progress Report 2010](#), see page 26

7.2.3 Air quality management areas (AQMA's)

AQMA's are areas in which air quality standards are considered unlikely to be achieved. They are declared by local authorities who are then required to create a Local Air Quality Action Plan through which to improve air quality. AQMA may be declared across different areas for different pollutants.

Huntingdonshire currently has four AQMA's:

- Huntingdon (NO₂) – southern part of the town centre, bounded largely by the A141 to the west, A14 to the south and the river to the east.
- St. Neots (NO₂) – area encompassing the junction of the High Street, St Neots, with New Street and South Street.
- Brampton (NO₂) – area encompassing properties at Wood View, Nursery Cottages, Thrapston Road, Bliss Close and Flamsteed Drive close to the A14 in Brampton and Hinchbrook
- Hemingford to Fenstanton (NO₂) – area encompassing a number of properties either side of the A14 between Hemingford and Fenstanton.

For more information see [DEFRA](#) web site.

For more details on air quality monitoring in Huntingdonshire, please read:

Huntingdonshire District Council air pollution web pages:

<http://www.huntingdonshire.gov.uk/Environment%20and%20Planning/Air%20Quality/Pages/default.aspx>

<http://www.huntingdonshire.gov.uk/Environment%20and%20Planning/Air%20Quality/Pages/default.aspx>

Cambridgeshire County Council air quality web pages: <http://www.cambridgeshire.gov.uk/environment/air/>

7.3. Waste and recycling

In 2009/10 Huntingdonshire produced 83,777 tonnes of household waste, which amounts to 29% of Cambridgeshire's total household waste (284,163). 30% of Huntingdonshire's household waste was recycled, the highest in the county.

Figure 19 shows that the amount of Huntingdonshire's land filled waste has decreased by 35% since 2003/04, while the amounts of recycled and composted waste have increased by 57% and 202% respectively. The large percentage growth in composted waste is due to the low starting total.

Figure 19: Household waste (tonnes) in Huntingdonshire by type, 2003/04-2009/10

Source: Cambridgeshire County Council Waste Management Team

Figure 20 shows that Huntingdonshire's level of total household waste has increased slightly since 2003/04.

Figure 20: Household waste (tonnes) by district, 2003/04-2009/10

Source: Cambridgeshire County Council Waste Management Team

Table 17 shows that, by comparison with the other districts, in 2009/10 Cambridge had neither the highest nor lowest figures for household waste, either in total or by waste category.

Table 17: Household waste (tonnes) in Huntingdonshire, 2009/10

	Cambridge	East Cambs	Fenland	Hunts	South Cambs	Overall
Recycled	10,905	6,739	13,048	25,425	14,173	70,290
Composted	10,892	6,736	14,228	22,953	21,258	76,067
Landfilled	28,153	19,864	24,701	35,399	29,689	137,806
Total	49,950	33,339	51,977	83,777	65,120	284,163

Source: Cambridgeshire County Council Waste Management Team

In terms of the respective district waste output totals, Huntingdonshire had the highest percentage of recycled household waste (30%) whilst East Cambridgeshire had the lowest (20%). South Cambridgeshire had the highest percentage of composted waste (33%) and East Cambridgeshire the lowest (20%). East

Cambridgeshire had the highest percentage of landfilled waste (60%) and Huntingdonshire the lowest (33%).

Of its total household waste, Huntingdonshire recycled 30%, composted 27%, and landfilled 42%.

Cambridgeshire County Council works in partnership with the five district councils and Peterborough City Council to manage waste. A new Cambridgeshire and Peterborough Minerals and Waste Plan is currently under consideration by the Secretary of State.

For more information please see our web page:

<http://www.cambridgeshire.gov.uk/environment/planning/mineralswasteframework/>

The County Council is required to conduct an annual assessment of its waste policy and targets. The 2010 Waste Annual Monitoring Report can be found here:

<http://www.cambridgeshire.gov.uk/environment/planning/mineralswasteframework/annualmonitoringreport.htm>

Up to date data on waste and recycling by Cambridgeshire local authority can be found here:

<http://www.cambridgeshire.gov.uk/environment/recycling/about/Measuring+our+performance.htm>

7.4. Land use

The Cambridgeshire County Council Research and Monitoring Team (R&M) have recently produced a report on land use in Cambridgeshire. The report maps land use in each district according to 13 major categories (including agricultural, wetland, residential, and industrial/commercial) and 52 sub-categories (including salt marshes, allotments, railways and offices). The full report and downloadable maps is available on the R&M web pages here: <http://www.cambridgeshire.gov.uk/environment/planning/projects/Landuse.htm>

8. Community insight

8.1. Introduction

It is essential that local authorities understand their citizens and local communities. A number of customer insight tools offer public services local intelligence in the hope to develop more efficient services. The Research Group are using Output Area Classification (OAC)¹¹ to provide deeper knowledge about the county. The socio-demographic data included in the classification allows us to describe the character and demography of local neighbourhoods down to output area level. OAC has been used to help analyse survey data, assist in service redesign, and display local intelligence.

8.2. Output Area Classification (OAC)

OAC is a geodemographic tool that uses data from the 2001 census to offer socio-demographic data for local neighbourhoods. OAC differs to other social classification tools in that it is freely available, accredited by the Office for National Statistics, and is an open source allowing users to understand the data and freely share it.

There are three levels to the classification including seven supergroups, 21 groups and 52 subgroups (see Table 19). Each output area in the country is assigned a specific classification. These classifications are based upon 41 key variables (shown in Table 18 below) from the 2001 Census. These cover demographic structure, household composition, housing, socio-economic, and employment factors. They represent the key social, economic and population trends in the UK.

Table 18: OAC's 41 census variables

Demographic	Household Composition	Housing	Socio-economic	Employment
Age 0-4 Age 5-14 Age 25-44 Age 45-64 Age 65+ Indian, Pakistani or Bangladeshi Black African, Black Caribbean or Other Black Born outside the UK Population Density	V10. Separated/ Divorced V11. Single person household (not pensioner) V12. Single pensioner household V13. Lone parent household V14. Two adults no children V15. Households with non-dependent children	V16. Rent (public) V17. Rent (private) V18. Terraced housing V19. Detached housing V20. All flats V21. No central heating V22. Average house size V23. People per room	V24. HE qualification V25. Routine/ Semi-Routine Occupation V26. 2+ Car Households V27. Public transport to work V28. Work from home V29. Limiting long term illness V30. Provide unpaid care	V31. Students (full-time) V32. Unemployed V33. Working part-time V34. Economically inactive looking after family V35. Agriculture/ Fishing employment V36. Mining/ quarrying/ construction employment V37. Manufacturing employment V38. Hotel & catering employment V39. Health and social work employment V40. Financial intermediation employment V41. Wholesale/ retail trade employment

¹¹ Additional information about OAC can be gained from our Social Classification webpage:
<http://www.cambridgeshire.gov.uk/business/research/Social+classification.htm>

Table 19: The different levels of OAC

Supergroups	Groups	Subgroups
1 Blue Collar Communities <u>Housing in these areas is more likely to be terraced rather than flats and residents mainly rent from the public sector. There is a high proportion of 5-14 year-olds. Residents tend to have fewer higher educational qualifications than the national average. A high proportion work in manufacturing, retail or construction.</u>	1a Terraced Blue Collar	1a1
		1a2
		1a3
	1b Younger Blue Collar	1b1
		1b2
	1c Older Blue Collar	1c1
2 City Living <u>Residents in these urban areas are more likely to live alone. They are more likely to hold higher educational qualifications and are often first generation immigrants to the UK. Housing is often made up of flats and detached homes are rare and residents typically rent their homes from the private sector.</u>		1c2
		1c3
	2a Transient Communities	2a1
		2a2
	2b Settled in the City	2b1
		2b2
3 Countryside <u>Residents in these rural areas are likely to work from home and to be employed in agriculture or fishing. They often live in detached houses; in households with more than one car. Areas are less densely populated than other parts of the country.</u>	3a Village Life	3a1
		3a2
	3b Agricultural	3b1
		3b2
	3c Accessible Countryside	3c1
		3c2
4 Prospering Suburbs <u>Residents in these prosperous areas often live in detached houses and less frequently in flats or terraced housing. Fewer residents rent their homes and homes are more likely to have central heating. Households often have access to more than one car.</u>	4a Prospering Younger Families	4a1

5c Public Housing	1	0.20
6a Settled Households	23	4.50
6b Least Divergent	50	9.78
6c Young Families in Terraced Homes	15	2.94
6d Aspiring Households	28	5.48
7a Asian Communities	1	0.20
7b African-Caribbean Communities	0	0.00
Total	511	100.00

A breakdown of Huntingdonshire by OAC group (Table 20) shows a more in-depth picture of the district. Each of the supergroups can be segmented into two or more groups to show the diverse nature of the district's communities. The county's largest supergroup Prospering Suburbs is segmented into four groups. One of these, Prospering Younger Families is the largest group in the district accounting for nearly 13% of output areas. The Countryside group Village Life is not far off; accounting for 12% of the districts output areas. Huntingdonshire has few groups that dominate; the district is in fact made up of a variety of groups that hold a significant number of output areas. Prospering Older Families and Least Divergent are also amongst the larger groups.

The Huntingdonshire OAC profile is diverse and this can be seen in the ward dna chart below (Figure 21). It clearly shows the make up of each of the districts wards and how it differs to the overall district and county profiles. A more in-depth picture of OAC in the district and the wider county can be viewed in [Cambridgeshire Atlas: OAC](http://map1.cambridgeshire.gov.uk/observe/Flash/OAC/atlas.html).¹²

¹² Cambridgeshire Atlas: Output Area Classification (OAC)
<http://map1.cambridgeshire.gov.uk/observe/Flash/OAC/atlas.html>

Figure 21: Huntingdonshire OAC ward 'dna' chart

8.4. Consultation database

Cambridgeshire County Council can conduct anywhere between 150 and 200 consultations per year. From large-scale postal surveys to finely selected focus groups. The topics they consider are related to the numerous council services on offer. Those that are consulted with include the general public, county council staff and certain hard to reach groups. With such a wide range of different consultations being conducted a huge amount of information is being collected. To help the council manage this and to also make the best use of all this information a Consultation Database has been set up.

The Consultation Database is a library of information about surveys and consultation projects undertaken by the County Council. The database was developed to ensure that surveys and consultation work undertaken across the authority is properly shared, preventing duplication or gaps, and allowing better planning and quality.

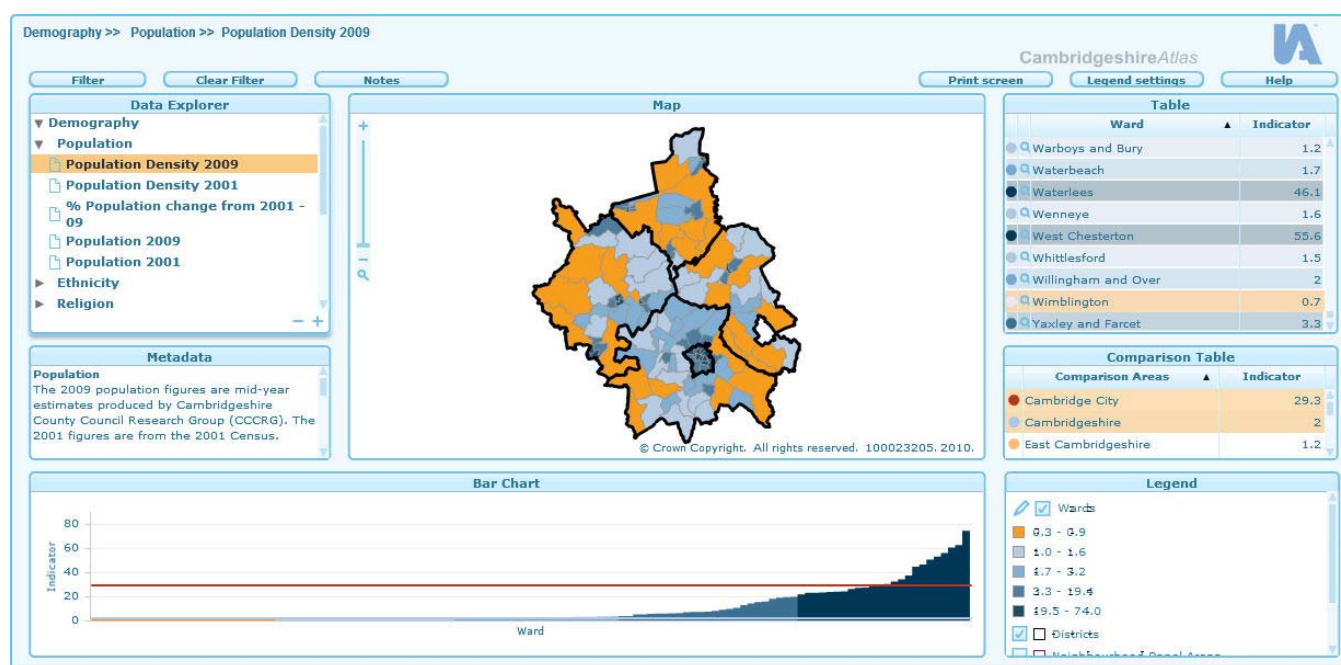

It contains information about surveys and consultations currently being undertaken, and work that is planned for the future. Past consultations are stored and these date back to April 2006. For each survey/consultation, the following information is available:

- Name of survey/ consultation
- Consultation status, including consultation period dates
- Brief details of the consultation
- Purpose of the consultation
- Contact details for the lead officer
- Major Findings (completed consultations)
- Links to relevant webpages

To discover consultations occurring in Huntingdonshire or the wider county area please explore the [consultation finder](#).¹³

8.5. Cambridgeshire atlas: ward profiles

Figure 22: Cambridgeshire Atlas: Ward Profiles

This atlas¹⁴ is our most comprehensive to date and includes a range of socio-economic and demographic data to develop a more complete picture of issues affecting local areas in Cambridgeshire. In all there are 85 indicators included, in seven categories. The data explorer can be used to investigate data for wards across the county and there is an on screen metadata box to explain the data showing on screen.

Appendices

Appendix 1: Huntingdonshire by district boundaries, roads, settlements and river

Appendix 2: Huntingdonshire ward boundaries

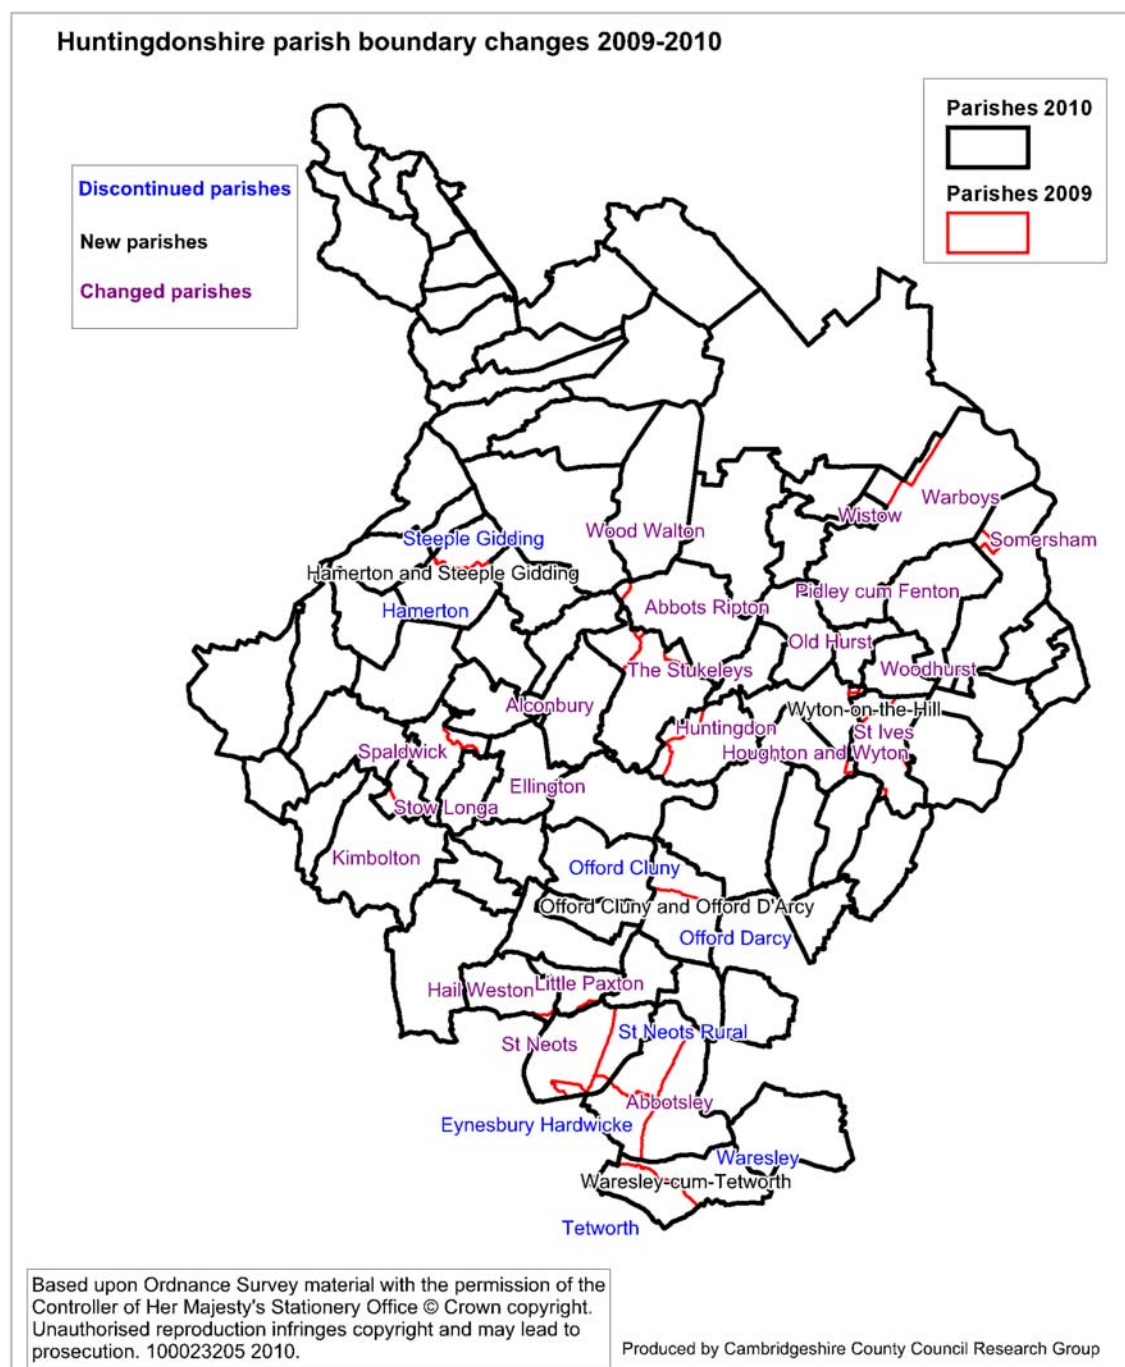

In 2010 Huntingdonshire district implemented a series of ward and parish boundary changes. Appendix 2 shows ward changes and Appendix 3 should the parish changes.

Appendix 2 shows the following changes:

- Part of Gransden and The Offords ward became part of St. Neots Priory Park.
- Part of Gransden and The Offords ward became part of St. Neots Eynesbury.
- Part of Alconbury and The Stukeleys ward became part of Huntingdon West.
- Two parts of Upward and The Raveleys ward became part of Alconbury and The Stukeleys.
- A small part of Earith ward became part of St Ives South.
- Part of St Ives South ward became part of the Hemingfords.
- Part of Ramsey ward became part of Warboys and Bury.

Appendix 3: Huntingdonshire parish boundaries

In the 2010 parish boundary changes 8 parishes were discontinued (labelled in blue) and 4 new parishes were created (labelled in black). All parishes labelled in purple also experienced boundary changes but were neither discontinued nor newly created.

Appendix 4: Demographic methodology and notes for users

Cambridgeshire County Council Research Group 2009-based population and dwelling stock forecasts

Forecasting Methodology

November 2010

This paper describes the methods, data and assumptions used to produce Cambridgeshire County Council Research Group's population forecasts. It accompanies the 2009-based suite of population and dwelling stock forecasts published in November 2010. The 2009-based forecasts run to 2031 and are available by local authority and ward and by age.

The 2009-based suite of forecasts comprises the following:

- Population forecasts by local authority district to 2031. A summary set of figures is published online, however the forecasts are available by single year of age and sex and for all years through to 2031 on request.
- Dwelling stock forecasts by local authority district and ward, through to 2031, for the years 2011, 2016, 2021, 2026 and 2031. These show the level of house-building that is assumed in the Research Group's published population forecasts.
- Population forecasts by ward to 2031, for broad age groups and for the years 2011, 2016, 2021, 2026 and 2031.

The 2009-based forecasts have been affected by a unique set of circumstances related to both policy changes and local conditions. These are discussed below. Readers requiring a full technical discussion of the entire methodology should read the whole document. Readers who are primarily interested in the unique circumstances surrounding these forecasts will find the Introduction and Section 2 of most use.

Summary

- The Research Group's (RG) local population forecasts take planned levels of house-building into account. The latest forecasts run to 2031 from a base year of 2009 and are consistent with dwelling figures specified by the East of England Plan draft revision Policy H1: Regional Housing Provision. This is a major revision of policy assumptions used in previous RG forecasts.
- The local authority forecasts are produced by ageing forward the population by sex and single year of age from 2009, year by year. Population change is forecast by allowing for the main components of population change: births and deaths (which together give natural change), and migration. This is the standard population forecasting methodology, as used by the Office for National Statistics (ONS).
- The forecasts assume the completion of over 70,000 additional dwellings in Cambridgeshire between 2009 and 2031. The primary driver for this assumption is the East of England Plan draft revision Policy H1: Regional Housing Provision of 68,000 additional dwellings between 2011 and 2031. The forecasts include the proposed Cambridge Fringe developments and the new town of Northstowe. However, uncertainty over housing policy and other local factors mean that these forecasts may be optimistic and should therefore be used in the knowledge of possible major revisions in future forecasts.

Introduction

Cambridgeshire County Council Research Group (RG) produces annual population and dwelling stock forecasts for the County, districts and wards. The RG's forecasts are 'policy led', which means that they are consistent with planned levels of house-building across the County. They are therefore different to projections produced by the Office for National Statistics (ONS), which are trend-based, meaning that they assume that recent trends will continue in the future (see Section 4 for further discussion).

While the forecasts are based on local policies, the location and phasing of housing development suggested within them does not represent County or district council policy. Rather they indicate possible population implications of development and other demographic change. All forecasts are based on a series of assumptions and are subject to change in the light of new information.

In previous years, the RG forecasts have been consistent with housing targets laid out in the East of England Plan (the Regional Spatial Strategy (RSS)), with phasing based on the district councils' December Annual Monitoring Report (AMR) housing trajectories. During 2009 and the early part 2010, work was underway to review the RSS and roll it forward to 2031. On 12th March 2010, the Regional Assembly approved the draft East of England Plan > 2031, which set out a revised set of Policy H1 house-building targets for the local authorities making up the Eastern Region.

Following the General Election, however, the incoming Communities and Local Government Secretary, Eric Pickles, announced his intention to abolish Regional Spatial Strategies, a move that left a vacuum in local authority housing policy. The 2009-based forecasts have therefore been based on the Policy H1 targets set out in the draft East of England Plan > 2031. These were chosen because there are no other consistent housing targets for Cambridgeshire that have official or policy status (though it should be noted that the Policy H1 figures used here are not actually part of a formal housing policy either).

As the draft East of England Plan > 2031 targets have been used, the forecasting period has been extended to 2031 instead of 2021, which was the target year under the original RSS. Phasing is still based on the district councils' December 2009 AMR housing trajectories. In addition, significant local factors affect the current forecasts. It is known, for example, that several developments in Cambridge and South Cambridgeshire are unlikely to take place as laid out in the 2009 AMR trajectories – details can be seen below (see Section 2 for more detail). At the time of producing these forecasts, however, it was unknown precisely how those developments would be affected. Since no alternative figures exist that could have provided guidance, the forecasts continue to assume that building in those developments will occur as shown in the trajectories.

Given these considerations the RG advises that the 2009-based population forecasts be used in the knowledge of possible major revisions in future forecasts.

When published elsewhere, the forecasts must be properly referenced¹⁵ and rounded to the nearest 100 people.

Definitions:

The total population figures are forecasts of the resident population. This definition is the same as that used in the 2001 Census as all students are counted at their term-time address. The forecasts include all persons living in communal establishments as well as those living in private households.

Forecasts of dwelling stock relate to the number of self-contained residential units whereby, if there is more than one separate area of living accommodation within a property, each is counted separately. Vacant properties, second homes and holiday homes are included, as are non-permanent dwellings, such as caravans and houseboats (where these are used for dwellings).

¹⁵ The forecasts should be referenced as:

Cambridgeshire County Council Research Group 2009-based ward level population and dwelling stock forecasts

Section 1: District-level forecasts

The RG uses an Excel spreadsheet model originally developed by Norfolk County Council and run at a district level. Figures for Cambridgeshire are aggregated from the district-level figures.

The main population forecasts are produced by ageing forward the population by sex and single year of age from a base date, year by year. Population change is forecast by allowing for the main components of population change: births and deaths (which together give natural change), and migration. This is the standard population forecasting methodology, as used, for instance, by the ONS. This section outlines the methodology in more detail.

1.1 Base Population

The base year for the population used in the latest forecasts is 2009. The base populations are derived from the RG's population model, run forward from an original base year of 2001 to give annual mid-year population estimates for each year since 2001. The original 2001 base is derived from the 2001 Census.

The population model is run to produce population estimates in the same way as it is run to produce population forecasts, as detailed below, except that actual births and deaths by age are input instead of forecast ones. Net migration rates are then adjusted until the model generates the estimated mid-year total population of the area concerned. This total estimated population is produced by rolling forward the 2001, census-based, total population on the basis of changes in electoral rolls, numbers of children aged 0-3 (from NHS GP Registrations), changes in school rolls and data on house-building. Changes in the transient population (principally students and members of the Armed Forces) are calculated separately, on the basis of annual surveys of institutional populations and other data sources.

The estimated population by age and sex calculated by the model is then calibrated with other known data, particularly for specific age-groups. The main groups used recently for calibration are 0-4s from the NHS GP Registrations, 4-15s from school rolls, 17+ population based on electoral rolls, older age groups from NHS GP registration data. The estimates produced by the model are further checked by comparing the numbers of households calculated by the model with information on numbers of dwellings completed since 2001.

An important feature of the population forecasting model, which is particularly applicable in Cambridgeshire, is the division of the population into two main groups: firstly, the resident or local population and, secondly, the transient population. The population contains a number of groups of significant size that have different characteristics to the rest of the usually resident or local population. People in the transient category include members of the armed forces living in barracks, students living in colleges and boarding schools and people living in places of detention. Armed forces personnel and their families living in married quarters and students living in ordinary households are included with the local, non-transient population. Experience suggests that most of the people in transient categories do not remain in the area for more than a few years. They therefore do not age forward with the local population through the forecast period but instead are regularly replaced by new people with similar demographic characteristics. Because of this the numbers of people in this transient sub-group are forecast separately and then added to the figures for the resident population produced by the main population forecasts to give overall population totals.

The base population is therefore split between the local population and the transient population. The 2001 base transient population is derived from the 2001 Census. The figures used in 2001 were numbers of people enumerated as "resident" (census definition) in relevant institutions.

1.2 Fertility Assumptions

Births are forecast by applying age-specific fertility rates to the numbers of women of child-bearing age in the local population. These age-specific fertility rates provide a basic fertility curve that can be adjusted upward or downward according to forecast changes in age-specific fertility. The numbers of births forecast in any year are therefore dependent on the forecast age-specific fertility rate and on the numbers of women in childbearing age groups. The forecast age-specific fertility rates used in the model are derived from the

national series used in the 2008-based ONS population projections. The national age-specific fertility rates are adjusted at district level to take account of differences between local and national fertility patterns. The adjustment is done on the basis of a detailed comparison of recent national and local age-specific rates.

1.3 Mortality Assumptions

The process by which deaths are calculated in the model is very similar to that used to calculate births. Deaths are forecast by applying age-specific mortality rates to the number of men and women in the local population. These rates provide a basic pattern of mortality that can be varied according to forecast changes in age- and sex-specific mortality rates. The number of deaths forecast in any one year is therefore a product of the sex and age structure of the population and the death rates being applied to the population in that year. The forecast sex- and age-specific mortality rates used in the model are derived from the national series used in the 2008-based ONS population projections. The national mortality rates are adjusted at district level to take account of differences between local and national mortality patterns. The adjustment is done on the basis of a detailed comparison of recent national and local age-specific rates.

1.4 Migration Assumptions

Migration is modelled in two stages: firstly, an age and sex structure of in- and out-migrants is determined; secondly, annual totals for the level of net migration are forecast. Net migration is the balance between migration into an area and migration from it. The age and sex structure of migrants gives the probability of migrants being of a particular age and sex. This structure is determined for the base year of the model and then fitted to forecast totals of net migration to produce numbers of migrants into or out of an area by sex and age.

The age and sex structure of migrants used in the model is based on that found at the 2001 Census for each district. Adjustments have been made to the age-structures of migrants in some districts during the course of running the model to produce annual mid-year estimates. Migration is the only variable in the model that significantly affects the size of many age-groups as they move through the population – the child and adult age-groups before the ages at which mortality begins to have a major impact. When calibration with other sources of age-group data, such as school rolls, suggested that too many or too few migrants were being added to or taken out of those age-groups, the age-structure of migration in the model was adjusted to bring changes in the total numbers in those year-groups back in line with the trends suggested by the other sources of data.

The model operates by holding out-migration constant (at 2001 levels) and adjusting in-migration to give an assumed rate of net migration. In this model run, in-migration is adjusted such that the number of households generated by the model is consistent with the number of dwellings that are expected to be built between 2009 and 2031 (see Section 2).

1.5 Reliability

Forecasts are only as accurate as the assumptions on which they are based. Assumptions used here about fertility, mortality and migration are based on the best available information, but they are complex factors with countless influences. It is impossible to predict the future; we can only make reasoned guesses based on what we know about the past and the present. The forecasts are continually revised as new assumptions become available. This means that current figures will differ to those published (for the same time frame) in previous years. In some cases differences may be quite considerable due to revised assumptions about the phasing of planned development.

The district level forecasts rely on dwelling targets being achieved and are therefore subject to the same reliability issues that affect the dwelling stock forecasts (see section 2.1 below). In general, the forecasts become less reliable the further they project into the future. The total population forecasts will be more reliable than for individual ages and sexes. Users are advised that figures have been rounded to the nearest 100 to avoid a spurious perception of accuracy.

Section 2: Dwelling stock forecasts

Dwelling stock forecasts form the basis of the population forecasts. In previous years these were based on RSS policy targets to 2021, but this year the draft East of England Plan > 2031 targets for the period 2011-2031 were used instead (see Introduction). Table 2 sets out the future levels of house-building assumed in the forecasting model. Overall, more than 73,000 additional dwellings are assumed will be completed between 2009 and 2031. These include the proposed Cambridge Fringe developments and the new town of Northstowe although caveats attached to those developments are outlined below (see Section 2.1).

Table 21: Summary of house building 2001-2031

<i>District</i>	<i>1: Actual completions 2001-2009</i>	<i>2: Interim building 2010-2011</i>	<i>3: draft East of England Plan > 2031 Policy H1: Regional Housing Provision 2011-2031</i>	<i>4: Total 2001-2031</i>	<i>5: Total 2009-2031</i>
Cambridge City	4,050	1,050	14,000	19,100	15,050
East Cambs	5,100	600	11,000	16,700	11,600
Fenland	5,350	800	11,000	17,150	11,800
Huntingdonshire	5,100	1,650	11,000	17,750	12,650
South Cambs	6,300	1,450	21,000	28,750	22,450
Cambridgeshire	26,000	5,550	68,000	99,450	73,550

Column 3 shows house-building provision for 2011-2031 as set out in the 2010 draft East of England Plan > 2031. In the absence of official policy targets, this provisional figure for each district is used as a target within the forecast.

Column 2 represents expected house building between the mid-2009 dwelling stock estimates and the beginning of the Policy H1 provision period, and is taken from the district council's December 2009 Annual Monitoring Report housing trajectories.

Column 5 (the sum of columns 2 and 3) shows total forecast house building from mid-2009 to mid-2031. Given the likelihood of change and complicated local factors the forecasts may represent an optimistic view.

The phasing and location of new housing by ward is determined through what was formerly the Local Plan process and is now the Local Development Framework (LDF) process. District councils produce annual housing trajectories, detailing the number and phasing of dwellings expected to come forward on individual sites. These trajectories are used to guide the distribution of house-building between wards and five-year time-bands, although some 'smoothing' may take place and the trajectories may not be followed exactly. The trajectories extend to April 2024 which leaves a phasing 'gap' between 2024 and 2031. Totals housing figures for that period (May 2024-April 2031) are simply the difference between the Policy H1 provision figure and the aggregate of building for the years 2011-2024 as laid out in each district's trajectory. The distribution of these additional dwellings is guided by the location of identified sites in district Core Strategies and discussion with district council planners, but the final decision rests with the RG and does not reflect district council policy.

The districts' trajectories follow financial years, while the RG forecasts reflect the mid-year point. For simplicity, the financial years are assumed to correspond to the nearest mid-year point. In other words, where a trajectory details development expected between April 2010 and March 2011, these are assumed to occur between mid-2010 and mid-2011 in our forecasts. We assume that the Policy H1 targets apply from the 2011/12 financial year through to the 2030/31 financial year.

2.1 Reliability & Local Factors

The district- and ward-level dwelling stock forecasts present an optimistic view of dwelling stock growth as they assume that all planned dwellings are built according to policy. In terms of planning for the future it is necessary to consider the full implications of policy, even if there are questions as to whether policy can be

achieved. The extent to which policy targets are achieved depends on many factors, including market forces and the economy. All development is subject to the development control system; development on designated sites depends on suitable planning applications being received from developers. In addition, “windfall” sites, which have not been allocated for housing growth, are likely to become available.

In addition to changes in overall housing policy, local factors may also affect the accuracy of these forecasts, especially in Cambridge City and South Cambridgeshire.

Relocation of Marshall Aerospace: the Cambridge East Development

Marshall has long said that it would be willing to relocate some of its Aerospace activities in order to accommodate the needs of Cambridge by making way for a large urban extension on its airfield in Cambridge, always provided that a suitable site could be found which would ensure the companies long term future and which was convenient for its customers, its local suppliers and its many highly skilled employees. Over the last few years, the company examined many potential relocation sites in the local area. Marshall have now concluded following an exhaustive evaluation of options that in the immediate future there are no suitable relocation options open to it. This does not rule out the possibility that circumstances may change again in future, in which case the company would be prepared to reconsider it.

Withdrawal of funding for A14 improvements: Northstowe and north west Cambridge

Since the publication of the South Cambridgeshire housing trajectory in 2009 emerging factors have raised questions over the delivery of some sites, particularly around the major developments on the edge of Cambridge and the new town of Northstowe. Factors affecting Northstowe primarily concern the Coalition Government's decision not to fund the A14 Ellington to Fen Ditton improvements, as announced in its October 2010 Comprehensive Spending Review. The implications of these announcements on the development strategy will be addressed in the South Cambridgeshire District Council's review of its Core Strategy. In addition, without the A14 upgrade, some developments in Huntingdonshire may not proceed.

Section 3: Ward level population forecasts

The mid-2009 population estimates by ward and age group form the base for the ward level forecasts. The total population change by age for each district for 2009-2011, 2011-2016, 2016-2021, 2021-2026 and 2026-2031 is taken from the district level forecasting model, as described above. Age changes are distributed between constituent wards on the basis of the distribution and phasing of housing growth as contained within the ward level dwelling stock forecasts. Changes are applied sequentially, such that the 2009 ward age estimates are used as the base for the 2011 forecasts, which then become the base for the 2016 forecasts, which then become the base for the 2021 forecasts, and so on. The method used is as follows.

The ward level forecasting methodology considers two distinct population groups. The first is the “new” population: people moving into new dwellings. People moving into new houses usually have different characteristics to the existing population and often tend to be younger. This is particularly the case for new settlements like Cambourne and Northstowe. The second is the “local” population: people currently living in existing housing in the area. This population is, in general, ageing, so the number of people in younger age groups is dropping while the number in older age groups is rising.

In terms of the “new” population, additional population is allocated to wards based on the number of additional dwellings forecast. An average of 2.5 people is allocated per new dwelling, with a relatively young age structure as indicated by Census data. This is slightly higher than the average household size in the population overall, reflecting the tendency for families and younger people to move into new housing. Total population change by age related to new dwellings across the district is then subtracted from overall population change by age. This leaves the population change that can be attributed to change in the “existing” population. This change is then distributed between wards on the basis of the ward's current population size and structure. In other words, change to the existing population is assumed to be equally spread (in proportional terms) across all the wards in a district.

3.1 Reliability

The ward age forecasts are subject to the same reliability issues as identified in Sections 1 and 2 above. In addition it should be noted that the methodology assumes the same average household size for all new dwellings, though it will vary depending on the size and types of dwellings actually built. Some wards may in reality show slightly higher or lower average household size amongst their new population. There is increasing pressure for new developments to include a range of housing types, however, and across a ward the average is unlikely to vary greatly from the district average. Further, the methodology assumes that change to the “existing” population is evenly spread across the district. In reality, some areas may age or change faster than others, depending on factors such as population turnover.

The total population forecast for each ward is more reliable than the age group breakdown. The forecasts will become less reliable the further they project into the future. When the age group forecasts are used, the age bands should be grouped as broadly as possible. All forecasts should be published rounded to the nearest 100. The age group forecasts are for planning purposes only and demonstrate the potential effects of possible demographic change and house building on local populations. The population forecasts themselves do not represent any form of population policy.

Section 4: Comparison with other population projections

These forecasts differ from those produced by the Office for National Statistics (ONS) in two main respects. Firstly, and most importantly, they are policy based rather than trend based. ONS projections use recent trends to project future changes. This means that projections for areas where the population has grown considerably in recent years (such as East Cambridgeshire, for example, due to the rapid growth that occurred in Ely) are likely to be an overestimate. For areas where significant growth is about to start, they are likely to underestimate growth. The RG policy based forecasts are based on the best available assessment of what is planned to occur within the forecast period.

Secondly RG projections are available at ward level. ONS produces projections at a local authority district (or PCT) level only. No information is available for wards or for market towns. The RG ward level forecasts are the only source of small area population forecasts available.

The RG forecasts also differ from those produced elsewhere as they benefit from local knowledge. This enables local factors, such as the student population, to be taken into consideration.

Appendix 5: 2009-based population forecasts by age groups in Huntingdonshire, 2001-2031

	<i>2001</i>	<i>2009</i>	<i>2011</i>	<i>2016</i>	<i>2021</i>	<i>2026</i>	<i>2031</i>
0-4	10,100	9,500	9,600	9,600	9,800	9,300	8,800
05-10	13,200	11,600	11,300	11,600	11,600	11,600	11,300

Yaxley and Farcet	3,750	4,500	4,600	4,700	4,700	4,800	4,950

Notes:

All figures are rounded to nearest 50 and may not sum to total shown due to rounding.

Estimate and forecast dwellings totals equal district level totals rather than the sum of each column.

2001 - Mid-year estimate based on census.

2009 - Mid-year estimate based on 2001 totals rolled forward on basis of information on housing completions, 2001-09.

2011, 2016, 2021, 2026 - Forecasts based mainly on published Local Authority trajectories, with some Research Group interpolation.

2031 - Forecasts based on 2010 East of England Plan draft revision POLICY H1: Regional Housing Provision 2011-2031

IMPORTANT: These forecasts should be considered provisional. The proposed abolition of the RSS and ongoing uncertainty over the future of some developments included here mean that there is considerable uncertainty over future housing targets and likely trajectories. Please see Methodology document for details.

~ Each column reflects mid-year figures. However, they are based on financial year figures from district trajectories as follows.

2011	2016	2021	2026	2031
2009/10- 2010/11	2011/12- 2015/16	2016/17- 2020/21	2021/22- 2025/26	2026/27- 2030/31
